ANATOMIA VETERINÁRIA APLICADA

Rg. CERVICAL

(Espécie Canina)

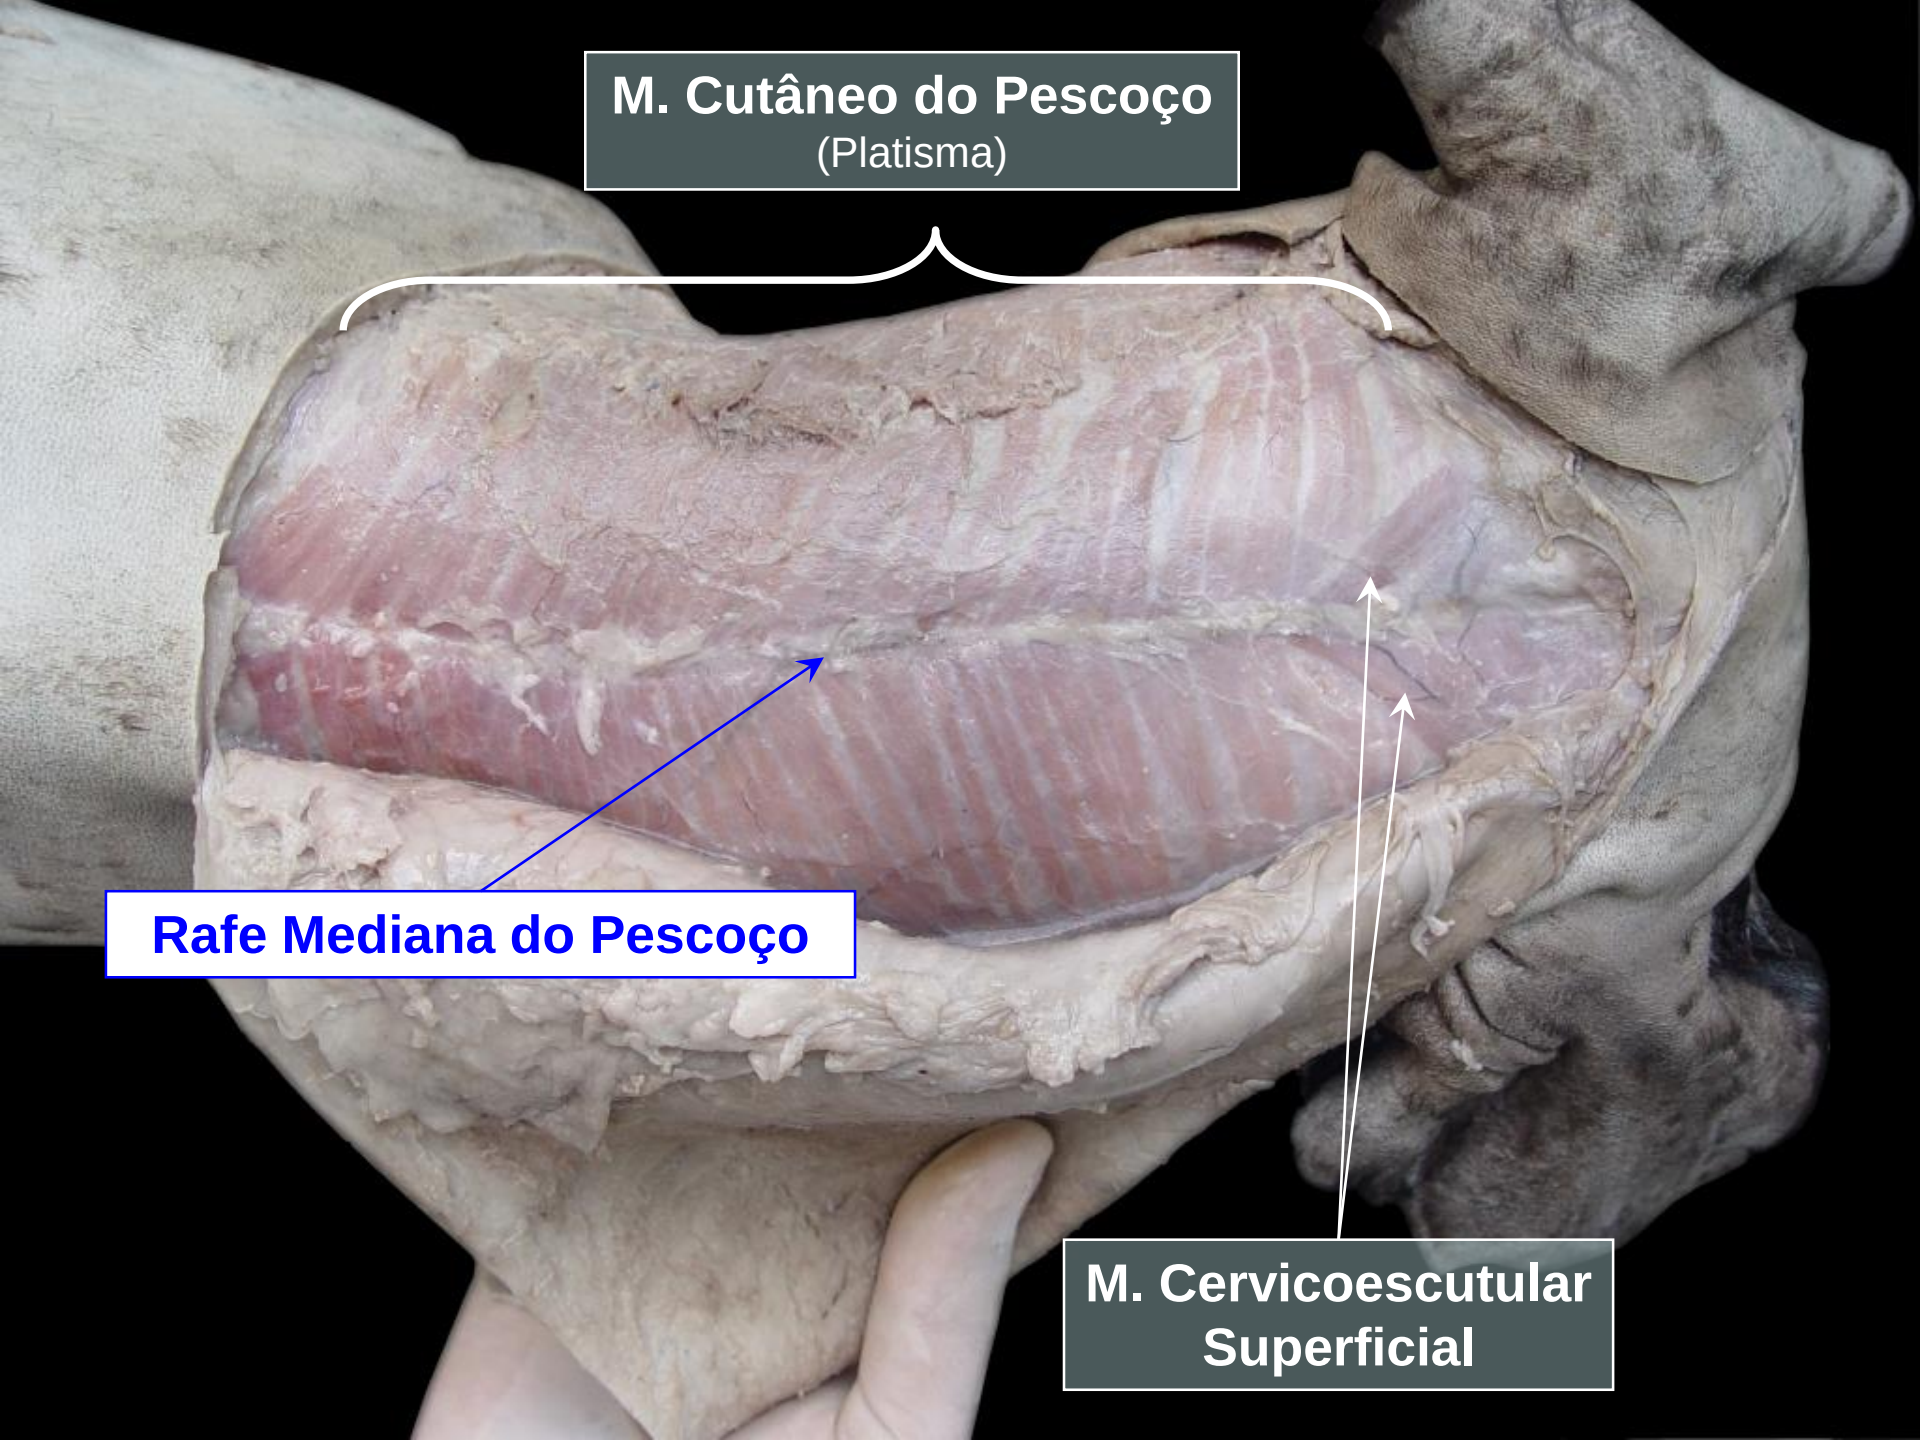

An anatomical dissection of a bovine head and neck. The skin has been partially removed to reveal the underlying musculature. The platysma muscle, a broad, thin muscle, is visible on the side of the neck. It is characterized by its pale, fibrous texture and is situated superficial to the deeper neck muscles. The dissection shows the relationship between the skin, the platysma, and the underlying structures of the neck. The text 'M. Cutâneo do Pescoço (Platisma)' is overlaid on the image, identifying the muscle.
