

# Chapter 2

## *True-False*

## Budget Constraint

---

Topic: Budget Constraint  
% Correct Responses: 90  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 10

**2.1** If there are two goods with positive prices and the price of one good is reduced, while income and other prices remain constant, then the size of the budget set is reduced.

---

Topic: Budget Constraint  
% Correct Responses: 76  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 24

**2.2** If good 1 is measured on the horizontal axis and good 2 is measured on the vertical axis, and if the price of good 1 is  $p_1$  and the price of good 2 is  $p_2$ , then the slope of the budget line is  $-p_2/p_1$ .

---

Topic: Budget Constraint  
% Correct Responses: 91  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 13

**2.3** If all prices are doubled and money income is left the same, the budget set does not change because relative prices don't change.

---

Topic: Budget Constraint  
% Correct Responses: 93  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 21

**2.4** If there are two goods, and if one good has a negative price and the other has a positive price, then the slope of the budget line will be positive.

---

Topic: Budget Constraint  
% Correct Responses: 94  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 12

**2.5** If all prices double and income triples, then the budget line will become steeper.

---

---

Topic: Budget Constraint  
% Correct Responses: 95  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 13

**2.6** If Good 1 is on the horizontal axis and Good 2 is on the vertical axis, then an increase in the price of Good 1 will not change the horizontal intercept of the budget line.

---

Topic: Budget Constraint  
% Correct Responses: 98  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 1

**2.7** If there are two goods and the prices of both goods rise, then the budget line must become steeper.

---

Topic: Budget Constraint  
% Correct Responses: 97  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 0

**2.8** There are two goods. You know how much of good 1 a consumer can afford if she spends all of her income on good 1. If you know the ratio of the prices of the two goods, then you could draw the consumer's budget line without any more information.

---

Topic: Budget Constraint  
% Correct Responses: 91  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 0

**2.9** A consumer prefers more to less of every good. Her income rises, and the price of one of the goods falls while other prices stay constant. These changes must have made her better off.

---

Topic: Budget Constraint  
% Correct Responses: 0  
Correct Answer: True

Difficulty: 2  
Discrimination Index: 0

**2.10** There are 3 goods. The price of good 1 is  $-1$ , the price of good 2 is  $+1$ , and the price of good 3 is  $+2$ . It is physically possible for a consumer to consume any commodity bundle with non-negative amounts of each good. A consumer who has income of 10 could afford to consume some commodity bundles that include 5 units of good 1 and 6 units of good 2.

---

Topic: Budget Constraint  
% Correct Responses: 80  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 49

**2.11** A decrease in income pivots the budget line around the bundle initially consumed.

---

---

Topic: Budget Constraint  
% Correct Responses: 97  
Correct Answer: A

Difficulty: 1  
Discrimination Index: 6

## 2.1

If she spends all of her income on lemons and tangerines, Isabella can just afford 30 lemons and 8 tangerines per day. She could also use her entire budget to buy 6 lemons and 14 tangerines per day. The price of lemons is 6 guineas each. How much is Isabella's income per day?

- (a) 372 guineas
  - (b) 377 guineas
  - (c) 371 guineas
  - (d) 363 guineas
  - (e) None of the above.
- 

Topic: Budget Constraint  
% Correct Responses: 97  
Correct Answer: A

Difficulty: 1  
Discrimination Index: 6

## 2.2

If she spends all of her income on uglifruit and breadfruits, Maria can just afford 11 uglifruit and 4 breadfruits per day. She could also use her entire budget to buy 3 uglifruit and 8 breadfruits per day. The price of uglifruit is 6 pesos each. How much is Maria's income per day?

- (a) 115 pesos
  - (b) 119 pesos
  - (c) 114 pesos
  - (d) 105 pesos
  - (e) None of the above.
-

---

Topic: Budget Constraint  
% Correct Responses: 0  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 0

**2.3** Matt lives on popcorn and seafood salads. The price of popcorn is 1 dollar per bag and the price of seafood salads is 2 dollars each. Matt allows himself to spend no more than 13 dollars a day on food. He also restricts his consumption to 5,500 calories per day. There are 1,000 calories in a bag of popcorn and 500 calories in a seafood salad. If he spends his entire money budget each day and consumes no more calories than his calorie limit:

- (a) he can consume up to 3 bags of popcorn per day, but no more.
  - (b) he can consume up to 1 bags of popcorn per day, but no more.
  - (c) he can consume up to 5 seafood salads per day, but no more.
  - (d) he can consume up to 4 bags of popcorn per day, but no more.
  - (e) None of the above.
- 

Topic: Budget Constraint  
% Correct Responses: 0  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 0

**2.4** Quincy lives on ding dongs and seafood salads. The price of ding dongs is 1 dollar per bag and the price of seafood salads is 4 dollars each. Quincy allows himself to spend no more than 23 dollars a day on food. He also restricts his consumption to 3,300 calories per day. There are 600 calories in a bag of ding dongs and 300 calories in a seafood salad. If he spends his entire money budget each day and consumes no more calories than his calorie limit:

- (a) he can consume up to 3 bags of ding dongs per day, but no more.
  - (b) he can consume up to 1 bags of ding dongs per day, but no more.
  - (c) he can consume up to 5 seafood salads per day, but no more.
  - (d) he can consume up to 4 bags of ding dongs per day, but no more.
  - (e) None of the above.
-

---

Topic: Budget Constraint  
% Correct Responses: 88  
Correct Answer: A

Difficulty: 1  
Discrimination Index: 20

**2.5** Teresa spends her entire budget and consumes 6 units of  $x$  and 20 units of  $y$ . The price of  $x$  is twice the price of  $y$ . Her income doubles and the price of  $y$  doubles, but the price of  $x$  stays the same. If she continues to buy 20 units of  $y$ , what is the largest number of units of  $x$  that she can afford?

- (a) 12
- (b) 6
- (c) 14
- (d) 16
- (e) There is not enough information to say.

---

Topic: Budget Constraint  
% Correct Responses: 88  
Correct Answer: A

Difficulty: 1  
Discrimination Index: 20

**2.6** Linda spends her entire budget and consumes 15 units of  $x$  and 19 units of  $y$ . The price of  $x$  is twice the price of  $y$ . Her income doubles and the price of  $y$  doubles, but the price of  $x$  stays the same. If she continues to buy 19 units of  $y$ , what is the largest number of units of  $x$  that she can afford?

- (a) 30
- (b) 15
- (c) 32
- (d) 34
- (e) There is not enough information to say.

---

Topic: Budget Constraint  
% Correct Responses: 50  
Correct Answer: C

Difficulty: 1  
Discrimination Index: 50

**2.7** In year 1, the price of good  $x$  was 1, the price of good  $y$  was 1, and income was 30. In year 2, the price of  $x$  was 6, the price of good  $y$  was 5, and income was 30. On a graph with  $x$  on the horizontal axis and  $y$  on the vertical, the new budget line is:

- (a) flatter than the old one and lies below it.
  - (b) flatter than the old one and lies above it.
  - (c) steeper than the old one and lies below it.
  - (d) steeper than the old one and lies above it.
  - (e) none of the above.
-

---

Topic: Budget Constraint  
% Correct Responses: 50  
Correct Answer: C

Difficulty: 1  
Discrimination Index: 50

**2.8** In year 1, the price of good  $x$  was 4, the price of good  $y$  was 2, and income was 60. In year 2, the price of  $x$  was 17, the price of good  $y$  was 8, and income was 60. On a graph with  $x$  on the horizontal axis and  $y$  on the vertical, the new budget line is:

- (a) flatter than the old one and lies below it.
  - (b) flatter than the old one and lies above it.
  - (c) steeper than the old one and lies below it.
  - (d) steeper than the old one and lies above it.
  - (e) none of the above.
- 

Topic: Budget Constraint  
% Correct Responses: 35  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 8

**2.9**

If she spends her entire budget, Vanessa can afford 47 apricots and 10 cherries. She can also just afford 20 apricots and 19 cherries. The price of apricots is 18 cents. What is the price of cherries in cents?

- (a) 64
  - (b) 3
  - (c) 21
  - (d) 54
  - (e) None of the above.
-

---

Topic: Budget Constraint  
% Correct Responses: 35  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 8

**2.10**

If she spends her entire budget, Heidi can afford 39 peaches and 12 pears. She can also just afford 24 peaches and 17 pears. The price of peaches is 9 cents. What is the price of pears in cents?

- (a) 37
  - (b) 3
  - (c) 12
  - (d) 27
  - (e) None of the above.
- 

Topic: Budget Constraint  
% Correct Responses: 100  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 0

**2.11** Heidi thrives on two goods: bananas and apples. The cost of bananas is 30 marks each and the cost of apples is 15 marks each. If her income is 210 marks, how many bananas can she buy if she spends all of her income on bananas?

- (a) 5
  - (b) 7
  - (c) 14
  - (d) 10
  - (e) None of the above
- 

Topic: Budget Constraint  
% Correct Responses: 100  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 0

**2.12** Teresa thrives on two goods: mangos and melons. The cost of mangos is 30 yen each and the cost of melons is 15 yen each. If her income is 180 yen, how many mangos can she buy if she spends all of her income on mangos?

- (a) 4
  - (b) 6
  - (c) 12
  - (d) 9
  - (e) None of the above
-

---

Topic: Budget Constraint  
% Correct Responses: 76  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 34

**2.13** Yoram spends his entire income on 11 sacks of acorns and 5 crates of butternuts. The price of acorns is 4 dollars per sack and his income is 94 dollars. He can just afford a commodity bundle with  $A$  sacks of acorns and  $B$  crates of butternuts which satisfies the budget equation:

- (a)  $4A + 12B = 94$ .
- (b)  $8A + 20B = 188$ .
- (c)  $6A + 10B = 94$ .
- (d)  $4A + 14B = 96$ .
- (e) None of the above.

---

Topic: Budget Constraint  
% Correct Responses: 76  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 34

**2.14** Eduardo spends his entire income on 12 sacks of acorns and 2 crates of butternuts. The price of acorns is 2 dollars per sack and his income is 34 dollars. He can just afford a commodity bundle with  $A$  sacks of acorns and  $B$  crates of butternuts which satisfies the budget equation:

- (a)  $2A + 7B = 34$ .
- (b)  $4A + 10B = 68$ .
- (c)  $4A + 5B = 34$ .
- (d)  $2A + 9B = 36$ .
- (e) None of the above.

---

Topic: Budget Constraint  
% Correct Responses: 99  
Correct Answer: C

Difficulty: 1  
Discrimination Index: 5

**2.15** Harry thrives on two goods, paperback novels and bananas. The cost of paperback novels is 4 dollars each and the cost of bananas is 3 dollars per bunch. If Harry spent all of his income on bananas, he could afford 12 bunches of bananas per week. How many paperback novels could he buy if he spent all of his income on paperback novels?

- (a) 36
  - (b) 48
  - (c) 9
  - (d) 16
  - (e) None of the above.
-

---

Topic: Budget Constraint  
% Correct Responses: 92  
Correct Answer: E

Difficulty: 1  
Discrimination Index: 25

**2.16** Suppose that the prices of good  $x$  and good  $y$  both double, and income triples. On a graph where the budget line is drawn with  $x$  on the horizontal axis and  $y$  on the vertical axis:

- (a) the budget line becomes steeper and shifts inward.
  - (b) the budget line becomes flatter and shifts outward.
  - (c) the budget line becomes flatter and shifts inward.
  - (d) the new budget line is parallel to the old budget line and lies below it.
  - (e) None of the above.
- 

Topic: Budget Constraint  
% Correct Responses: 96  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 18

**2.17** Suppose that the price of good  $x$  triples and the price of good  $y$  doubles while income remains constant. On a graph where the budget line is drawn with  $x$  on the horizontal axis and  $y$  on the vertical axis, the new budget line:

- (a) is flatter than the old one and lies below it.
  - (b) is flatter than the old one and lies above it.
  - (c) crosses the old budget line.
  - (d) is steeper than the old one and lies below it.
  - (e) is steeper than the old one and lies above it.
- 

Topic: Budget Constraint  
% Correct Responses: 0  
Correct Answer: C

Difficulty: 3  
Discrimination Index: 0

**2.18** While traveling abroad, Tammy spent all of the money in her purse to buy 5 plates of spaghetti and 6 oysters. Spaghetti costs 8 units of the local currency per plate and she had 82 units of currency in her purse. If  $s$  denotes the number of plates of spaghetti and  $o$  denotes the number of oysters purchased, the set of commodity bundles that she could just afford with the money in her purse is described by the equation:

- (a)  $82 + 6o = 82$ .
  - (b)  $6s + 8o = 82$ .
  - (c)  $8s + 7o = 82$ .
  - (d)  $5s + 6o = 82$ .
  - (e) There is not enough information to determine the answer.

**2.19** Billy Bob wants to gain some weight so that he can play football. Billy eats only milkshakes and spinach. Milkshakes cost him \$1 each and spinach costs \$2 per serving. A milkshake has 850 calories and a serving of spinach has 200 calories. Billy Bob never spends more than \$20 a day on food and he always consumes at least 8000 calories per day. Which of the following is necessarily true?

- (a) Billy Bob consumes at least 9 milkshakes a day.
  - (b) Billy Bob never consumes more than 6 servings of spinach a day.
  - (c) Billy Bob never consumes positive amounts of both goods.
  - (d) Billy Bob consumes only milkshakes.
  - (e) None of the above.
-

% Correct Responses: 81  
Correct Answer: D

Difficulty: 2  
Discrimination Index: 21

**2.20** Lars consumes only potatoes and herring. When the price of potatoes was 9 crowns per sack and the price of herring was 5 crowns per crock, he spent his entire income to buy 5 sacks of potatoes and 10 crocks of herring per month. Now the government subsidizes potatoes. Market prices haven't changed, but consumers get a subsidy of 5 crowns for every sack of potatoes consumed. To pay for this subsidy, the government introduced an income tax. Lars pays an income tax of 20 crowns per month. If  $s$  is the number of sacks of potatoes and  $c$  is the number of crocks of herring, what is Lars's NEW budget equation?

- (a)  $9s + 5c = 100$ .
  - (b)  $14s + 5c = 95$ .
  - (c)  $4s + 5c = 95$ .
  - (d)  $4s + 5c = 75$ .
  - (e)  $14s + 5c = 120$ .

Discrimination Index: 26

**2.25** Your budget constraint for the two goods  $A$  and  $B$  is  $6A + 3B = I$  where  $I$  is your income. You are currently consuming more than 12 units of  $B$ . In order to get 2 more units of  $A$ , how many units of  $B$  would you have to give up?

- (a) 0.50
  - (b) 0.25
  - (c) 2
  - (d) 4
  - (e) None of the above.
-

Topic: Budget Constraint  
 % Correct Responses: 70  
 Correct Answer: A

Difficulty: 2  
 Discrimination Index: 32

**2.26** Young Alasdair loves lollipops and hates oatmeal. To induce him to eat enough oatmeal and to restrain him from eating too many lollipops, his mum pays him 10 pence for every quart of oatmeal that he eats. The only way that he can get lollipops is to buy them at the sweet shop, where lollipops cost 5 pence each. Besides what he earns from eating oatmeal, Alasdair gets an allowance of 10 pence per week. If Alasdair consumes only oatmeal and lollipops and if his consumption bundles are graphed with quarts of oatmeal on the horizontal axis and lollipops on the vertical axis, then Alasdair's budget line:

- (a) has a slope of 2.
- (b) has a slope of less than  $-2$ .
- (c) has a slope of  $-2$ .
- (d) has a slope of  $1/2$ .
- (e) has a slope greater than 2.

**2.2** Brenda likes hot dogs and Coca-Cola. Hot dogs cost \$1 each and Cokes cost \$.50 per bottle. There is a special promotion for Coke that will last for one month. If Brenda sends in the bottle tops from the Cokes she drinks during the next month, she will get a refund of \$.20 for every bottlecap beyond the first 12 that she returns. For example, if she returns 25 bottle caps she will get back  $\$2.60 = \$.20(25 - 12)$ . Brenda has \$40 to spend on hot dogs and Coke during the next month. Draw her budget line with Coke on the horizontal axis and hot dogs on the vertical axis. Find the points where the budget line hits the axes and the point where it has a kink. At each of these three points write down the quantities of each good consumed.

*Answer:* The budget line runs from (0,40) on the vertical axis to a kink point (12,34) and from (12,34) to about (125.3,0).

**2.3** Felicity is studying economics and political science. She can read 30 pages of political science per hour but only 5 pages of economics per hour. This week she has a 50 page assignment in economics and a 150 page assignment in political science. Because of sorority rush, she cannot devote more than 10 hours to studying these subjects this week. She realizes she cannot complete all of her assignments but is determined to complete at least 30 pages of her economics reading. Draw a graph with pages of economics on the horizontal axis and pages of political science on the vertical axis. On this graph, show the possibilities that are consistent with the constraints that Felicity has imposed on herself. (She is allowed to read ahead in either subject.) Label key points on your graph with their numerical values.

*Answer:* Anything in the triangle bounded by  $(0, 300)$ ,  $(30, 120)$  and  $(30, 0)$  satisfies these constraints.

**2.4** Ed Moore and his family live in a city with many private schools and one public school. The Moores are thinking of sending their only child to private school because they would like a school that has more teachers and other resources per student than the local public school. The Moores must pay taxes to support local public schools whether or not their child goes to private school. There is such a variety of private schools that the Moores can get just about any level of inputs per student by choosing the appropriate private school. Tuition in the private schools equals expenditure per student. Draw a diagram to show the Moores' budget constraint. Put expenditures per student in the child's school on the horizontal axis and other goods on the vertical.

*Answer:* One point is  $(x, d)$  where  $x$  is expenditures per pupil in public school and  $d$  is disposable income. The rest of the budget is a line with slope  $-1$  from  $(2s, d - x)$  to the  $x$  axis.

**3.18** Nancy Lerner is taking a course from Professor Goodheart who will count only her best midterm grade and from Professor Stern who will count only her worst midterm grade. In one of her classes, Nancy has scores of 40 on her first midterm and 50 on her second midterm. When the first midterm score is measured on the horizontal axis and her second midterm score on the vertical, her indifference curve has a slope of zero at the point (40, 50). Therefore it must be that:

- (a) this class could be Professor Goodheart's, but couldn't be Professor Stern's.
  - (b) this class could be Professor Stern's, but couldn't be Professor Goodheart's.
  - (c) this class couldn't be either Goodheart's or Stern's.
  - (d) this class could be either Goodheart's or Stern's.
  - (e) None of the other options are correct.
-

**3.24** Scholastica is taking a class from Professor Chaos. Professor Chaos gives two tests in this course and determines a student's grade as follows. He calculates the smaller of the following two numbers: half of the score on the first test (which is a relatively easy test) and the actual score on the second test. He gives each student a numerical score equal to the result of this calculation and then ranks the students. Scholastica would like to be ranked as high as possible in Professor Chaos' rankings. If we represent her score on the first exam on the horizontal axis and her score on the second exam on the vertical axis, then her indifference curves:

- (a) are L-shaped with kinks where the two exam scores are equal.
  - (b) have sections with a slope  $-2$  and sections with a slope  $1/2$ .
  - (c) are positively sloped.
  - (d) are L-shaped with kinks where the exam 1 score is twice the exam 2 score.
  - (e) are straight lines with a slope of  $-1/2$ .
-

**3.2** Coach Steroid likes his players to be big, fast, and obedient. If player  $A$  is better than player  $B$  in two of these three characteristics, Steroid will prefer  $A$  to  $B$ . Three players try out for quarterback. Wilbur Westinghouse weighs 320 pounds, runs very slowly, and is quite obedient. Harold Hotpoint weighs 240 pounds, runs extremely fast, and is extremely disobedient. Jerry Jacuzzi weighs 150 pounds, runs at average speed, and is extremely obedient. Does Coach Steroid have transitive preferences? Explain your answer.

*Answer:* No. Steroid prefers  $W$  to  $H$  because  $W$  is heavier and more obedient. He prefers  $H$  to  $J$  because  $H$  is heavier and faster. But he prefers  $J$  to  $W$  because  $J$  is more obedient and faster than  $W$ . Since his preferences have a cycle, they cannot be transitive.

**3.4** Mac Rowe doesn't sweat the petty stuff. In fact, he just cannot detect small differences. He consumes two goods,  $x$  and  $y$ . He prefers the bundle  $(x, y)$  to the bundle  $(x', y')$  if and only if  $xy - x'y' > 1$ . Otherwise he is indifferent between the two bundles. Show:

(a) that the relation of indifference is not transitive for Mac (Hint: Give an example.)

(b) that the preferred relation is transitive for Mac.

*Answer:* Consider the bundles  $A = (1, 1)$ ,  $B = (1, 1.75)$ ,  $C = (1, 2.5)$ . Then A is indifferent to B and B to C but C is preferred to A. To see that strict preference is transitive, suppose we have any three bundles,  $(x, y)$ ,  $(x', y')$  and  $(x'', y'')$ . If the first is preferred to the second and the second to the third, then  $xy - x'y' > 1$  and  $x'y' - x''y'' > 1$ . Simple algebra shows that  $xy - x''y'' > 1$ . Therefore the first must be preferred to the third.

**3.6** Explain how it would be possible to cheat someone who had intransitive preferences. Be explicit about what you would offer him if you were trying to exploit his intransitivity and what he would do in response.

*Answer:* Suppose that he has bundle  $C$  right now and prefers A to B, B to C, and C to A. If you offer him a trade that leaves him at B instead of C, he will accept the deal. If you now offer him a trade that leaves him at A instead of B, he will accept that. But he will prefer to be back where he originally was to where he is. So you could offer to give him back his original bundle, minus a reward to you for your efforts and he would accept the deal.

**4.1** Jim's utility function is  $U(x, y) = xy$ . Jerry's utility function is  $U(x, y) = 1000xy + 2000$ . Tammy's utility function is  $U(x, y) = xy(1 - xy)$ . Oral's utility function is  $U(x, y) = -1/(10 + 2xy)$ . Marjoe's utility function is  $U(x, y) = x(y + 1000)$ . Pat's utility function is  $U(x, y) = .5xy - 10000$ . Billy's utility function is  $U(x, y) = x/y$ . Francis's utility function is  $U(x, y) = -xy$ . (a) Who has the same preferences as Jim? (b) Who had the same indifference curves as Jim? (c) Explain why the answers to (a) and (b) differ.

*Answer:* Jerry, Pat and Oral have the same preferences as Jim since their utility functions are monotonic transformations of Jim's. Jerry, Pat, Oral, Tammy, and Francis have the same indifference curves as Jim, but Tammy and Francis have different preferences. Francis' utility function is a decreasing transformation of Jim's, so he orders his indifference curves in the opposite way. Tammy's utility function is a transformation of Jim's but is sometimes increasing sometimes decreasing.

Correct Answer: True

**5.10** Millie's utility function is  $U(x, y) = \min\{x, y\}$ . She maximizes her utility subject to a budget constraint. The price of  $x$  is the same as the price of  $y$ . If the price of  $x$  rises and the price of  $y$  and her income remain constant, then her consumption of  $y$  will certainly decrease.

**5.17** Danny Featherweight is taking a tough course in law school. His prof agreed to give him a course grade of  $\max\{2x, 3y\}$  where  $x$  and  $y$  are the number of answers he gets right on the first and second midterms, respectively. Danny needs a course grade of 150 to pass. He finds that for the first midterm, for every  $A$  minutes of study, he will get one more answer right. For the second midterm, for every  $B$  minutes that he studies, he will get one more answer right. If he doesn't study at all, Danny will get nothing right on either exam. All Danny cares about is passing. He doesn't want to waste any time getting a higher grade than he needs.

- (a) If  $A/B < 2/3$ , then Danny will not study for the second exam.
  - (b) The ratio of the time Danny spends on exam 1 to the time he spends on exam 2 will be  $2A/3B$ .
  - (c) The ratio of the time Danny spends on exam 2 to the time he spends on exam 1 will be  $3A/2B$ .
  - (d) If  $A < B$ , then Danny will not study for the first exam.
  - (e) Danny will spend  $150/(2A + 3B)$  minutes studying for each exam.

**5.38** Justin consumes goods  $X$  and  $Y$  and has a utility function  $U(x, y) = x^2 + y$ . The price per unit of  $X$  is  $p_x$  and the price per unit of  $Y$  is  $p_y$ . He has enough money so that he can afford at least 1 unit of either good. When he chooses his best affordable bundle, it must necessarily be that:

- (a) his budget line is tangent to the indifference curve passing through this bundle.
  - (b) he consumes only  $x$ .
  - (c) he consumes only  $y$  if  $p_x^2/p_y$  exceeds his income.
  - (d) he consumes some of each good if  $p_x = p_y$ .
  - (e) he consumes some of each good if  $p_y = p_x/2$ .

**5.45** Our old friend, Edmund Stench, of Chapter 2 loves punk rock video tapes. He has no income and therefore has to accept garbage in his backyard in return for money. Each video tape cost \$2 and each sack of garbage that he accepts brings him \$1. His utility function is given by  $U(c, g) = \min\{2c, 20 - g\}$  where  $c$  is the number of video tapes and  $g$  is the number of sacks of garbage that he gets per month. Each month he will choose to accept:

- (a) 20 sacks of garbage.
  - (b) no garbage.
  - (c) 5 sacks of garbage.
  - (d) 10 sacks of garbage.
  - (e) 15 sacks of garbage.

**5.1** Max has the utility function  $U(x, y) = x(y + 1)$ . The price of  $x$  is 2 and the price of  $y$  is 1. Income is 10. How much  $x$  does Max demand?. How much  $y$ ? If his income doubles and prices stay unchanged, will Max's demand for both goods double?

*Answer:* To set his MRS equal to the price ratio, Max sets  $(y + 1)/x = 2$ . His budget constraint is  $2x + y = 10$ . Solve these two equations to find that  $x = 11/4$  and  $y = 9/2$ . If his income doubles and prices stay unchanged, his demand for both goods does not double. A quick way to see this is to note that if quantities of both goods doubled, the MRS would not stay the same and hence would not equal the price ratio, which has stayed constant.

**5.2** Casper consumes cocoa and cheese. Cocoa is sold in an unusual way. There is only one supplier, and the more cocoa you buy from him, the higher the price you have to pay per unit. In fact  $y$  units of cocoa will cost Casper  $y^2$  dollars. Cheese is sold in the usual way at a price of 2 dollars per unit. Casper's income is 20 dollars and his utility function is  $U(x, y) = x + 2y$  where  $x$  is his consumption of cheese and  $y$  is his consumption of cocoa. a) Sketch Casper's budget set and shade it in. b) Sketch some of his indifference curves and label the point that he chooses. c) Calculate the amount of cheese and the amount of cocoa that Casper demands at these prices and this income.

*Answer:* This problem is different from those in the text and is designed to see whether the student can use the tools presented there in a creative way. The budget set is a convex set and the solution is a point of tangency. Casper demands 2 units of cocoa and 16 units of cheese.

**6.17** Ms. Laura Mussel's preferences between golf and tennis are represented by  $U(g, t) = gt$  where  $g$  is the number of rounds of golf and  $t$  is the number of tennis matches she plays per week. She has \$24 per week to spend on these sports. A round of golf and a tennis match each cost \$4. She used to maximize her utility subject to this budget. She decided to limit the time she spends on these sports to 16 hours a week. A round of golf takes 4 hours. A tennis match takes 2 hours. As a result of this additional constraint on her choice, you conclude that:

- (a) she plays one less round of golf and one more tennis match each week.
  - (b) she plays more golf and less tennis, but can't say how much.
  - (c) her choices and her utility are unchanged.
  - (d) there is too little information to tell about her choices.
  - (e) she plays 2 less rounds of golf and 3 more rounds of tennis per week.

**6.45** John Parker Nosey works for the Internal Revenue Service. He is in charge of auditing income of self-employed people. In any year, a person divides his total income between consumption and saving. John cannot determine people's consumptions, but he is able to determine how much people have saved over the course of a year. From years of experience, he has learned that people act as if they are maximizing a utility function of the form  $U(c, s) = 10,000 \ln c + s$ , where  $c$  is the number of dollars worth of consumption in a year and  $s$  is the number of dollars saved. Which of the following is true?

- (a) If someone saves at least \$1,000, then that person's income is at least \$11,000.
  - (b) If someone saves nothing, then that person must earn less than \$1,000.
  - (c) If someone saves exactly \$1,000, then that person's income must be greater than \$1,000 and less than \$10,000.
  - (d) If someone saves exactly \$10,000, then that person must earn exactly \$21,000.
  - (e) If someone saves more than \$1,000, then that person's income must be more than \$20,000.

**6.1** Is the following statement true or false? "If consumers spend their entire incomes, it is impossible for the income elasticity of demand for every good to be bigger than one." Write a brief, but convincing explanation of your answer.

*Answer:* True. If income elasticities of demand for all goods exceed 1, then a 1% increase in income would result in a more than 1% increase in expenditures for every good. Therefore total expenditures would rise by more than 1%. But this is impossible if the entire budget is spent both before and after the income increase.

**6.2** Wanda Lott's utility function is  $U(x, y) = \max\{2x, y\}$ . Draw some of Wanda's indifference curves. If the price of  $x$  is 1, the price of  $y$  is  $p$  and her income is  $m$ , how much  $y$  does Wanda demand?

*Answer:* Wanda's indifference curves are rectangles that are twice as high as they are wide. If  $p > .5$ , Wanda demands no  $y$ . If  $p < .5$ , Wanda demands  $m/p$  units of  $y$ . If  $p = .5$ , Wanda is indifferent between her two best options which are buying  $m$  units of  $x$  and no  $y$  or buying  $2m$  units of  $y$  and no  $x$ .

**6.6** Ray Starr has the utility function  $U(x, y) = y/(100 - x)$ . a) Does Ray prefer more to less of both goods? b) Draw a diagram showing Ray's indifference curves corresponding to the utility levels  $U = 1/2$ ,  $U = 1$ , and  $U = 2$ . c) How can you describe the set of indifference curves for Ray? d) If the price of  $x$  is 1 and the price of  $y$  is 1, find Ray's demand for  $x$  as a function of his income and draw a diagram showing his Engel curve for  $x$ .

*Answer:* a) Yes. b) These curves are straight lines with the equations  $x/2 + y = 50$ ,  $x + y = 100$ ,  $2x + y = 200$ . c) The indifference curve through any bundle is the straight line passing through that point and through the point  $(100, 0)$ . The set of all indifference curves is the *star*-shaped set of rays passing through the point  $(100, 0)$  (to be more *precise*, the part of that set that is in the nonnegative quadrant). d) If Ray's income is less than 100, he buys  $y$  and no  $x$ . If his income is more than 100, he buys  $x$  and no  $y$ .

**6.7** With some services, e.g. checking accounts, phone service, or pay TV, a consumer is offered a choice of two or more payment plans. One can either pay a high "entry fee" and get a low price per unit of service or pay a low entry fee and a high price per unit of service. Suppose you have an income of \$100. There are two plans. Plan A has an entry fee of \$20 with a price of \$2 per unit. Plan B has an entry fee of \$40 with a price of \$1 per unit for using the service. Let  $x$  be expenditure on other goods and  $y$  be consumption of the service. a) Write down the budget equation that you would have after you paid the entry fee for each of the two plans. b) If your utility function is  $xy$ , how much  $y$  would you choose in each case? c) Which plan would you prefer? Explain.

*Answer:* a)  $x + 2y = 80$ ,  $x + y = 60$ . b) 20, 30 c) Plan B. The utility of the bundle chosen with A is  $20 * 40 = 800$  and the utility from the Plan B bundle is  $30 * 30 = 900$ .

**7.22** Recall that the Laspeyres price index uses the old bundle as weights and the Paasche price index uses the new bundle as weights. If the prices of all goods double and your income triples, then:

- (a) your income increase has exceeded the increase in the Laspeyres P.I. but may not have exceeded the increase in the Paasche P.I.
  - (b) your income increase has exceeded the increase in the Laspeyres P.I. and has also exceeded the increase in the Paasche P.I.
  - (c) your income increase has exceeded the increase in the Paasche P.I. but may not have exceeded the increase in the Laspeyres P.I.
  - (d) you would need to know the old and new consumption bundles to compare your income change with the change in price indexes.
  - (e) None of the above.
-

**7.28** Tonal is a travelling substitute orchestra conductor. Each year, he starts in Ann Arbor, moves to Brownsville, then to Carson City, ..., and so on until he reaches Zilvania, Ohio, after which he returns to Ann Arbor. He gets a salary according to the following simple rule. In Brownsville he is paid what his Ann Arbor consumption bundle would cost in Brownsville. In Carson City, he is paid what his Brownsville bundle would cost in Carson City, and so on. After 26 two-week stints, he returns to Ann Arbor, where he is paid the cost in Ann Arbor of his Zilvania bundle. At each stop, he spends his entire salary on apples (A) and paperback books (B), so as to maximize the utility  $U = AB$ . Over the course of the year, his utility will:

- (a) be constant at every stop.
- (b) increase at every stop where relative prices are different from the previous stop.
- (c) decrease at every stop where relative prices are different from the previous stop.
- (d) increase or decrease depending on whether the Paasche price index goes down or up between stops.
- (e) increase or decrease depending on whether the Laspeyres price index goes down or up between stops.

Correct Answer: D

**7.39** Howard Send is deciding whether to keep his car when he moves to New York City. To operate his car for a year, he would have to pay a flat fee of \$6,000 for auto insurance and parking, plus 20 cents for every mile that he drives for gasoline and repairs. Alternatively, he could give his car to his brother-in-law in Buffalo (the market value of the car is negligible) and take taxicabs in New York, which costs \$1 a mile. Howard knows that if he took the car to New York, he would drive 6500 miles per year. If he places no value, positive or negative, on his *brother-in-law* getting the car and if he is indifferent between riding a cab and driving, he should:

- (a) keep his car if he wouldn't want to travel as much as 6500 miles by cab.
- (b) give his car away if he wouldn't travel more than 6000 miles by cab but keep it if he would travel more than 6000 miles by cab.
- (c) keep his car if he would travel more than 6,000 but less than 6,500 miles by cab.
- (d) give his car away.
- (e) There is not enough information given here to allow one to give him reasonable advice about what to do.

**8.6** The following can be said about the income and substitution effects of a price increase on the demand for the good whose price rose:

- (a) The former is always positive and the latter is always negative.
- (b) Both can be either positive or negative.
- (c) While the latter is always negative, the former can be either positive or negative.
- (d) While the former is always negative, the latter can be either positive or negative.
- (e) The former can at times be negative, but it will never overwhelm the latter.

**8.7** In 1989, Bruce spent his income on two goods  $x$  and  $y$ . Between 1989 and 1990, the price of good  $x$  rose by 8 per cent and the price of good  $y$  rose by 8 per cent. In 1990, Bruce bought the same amount of  $x$  as he bought in 1989, but he bought more of good  $y$  than he had bought in 1989. From these facts, we conclude that:

- (a)  $y$  is a normal good.
- (b)  $y$  is an inferior good.
- (c)  $x$  is an inferior good.
- (d) nothing can be said about inferiority or superiority, since we don't know what happened to income.
- (e) Bruce is acting irrationally, since the relative prices of  $x$  and  $y$  did not change.

**8.8** When the price of  $x$  rises, Marvin responds by changing his demand for  $x$ . The substitution effect is the part of this change that represents his change in demand:

- (a) holding the prices of substitutes constant.
- (b) if he is allowed to substitute as much  $x$  for  $y$  as he wishes.
- (c) if his money income is held constant when the price of  $x$  changes.
- (d) if the prices of all other goods are held constant.
- (e) none of the above.

**8.11** Charlie consumes apples and bananas. His utility function is  $U(X_A, X_B) = x_A x_B^2$ . The price of apples is \$1, the price of bananas is \$2 and his income is \$30 per week. If the price of bananas falls to \$1:

- (a) Charlie demands fewer apples and more bananas.
  - (b) the substitution effect of the fall in banana prices reduces his APPLE consumption, but the income effect increases his apple consumption by the same amount.
  - (c) the substitution effect of the fall in the price of bananas reduces his BANANA consumption but the income effect increases his banana consumption by enough so that his banana consumption rises.
  - (d) the income used to calculate the substitution effect is higher than his original income, since the change made Charlie better off.
  - (e) more than one of the above is true.
-

**8.2** Use a diagram to prove that in case there are two goods, the substitution effect of an increase in the price of good  $x$  reduces the demand for good  $x$ .

*Answer:* A good way to proceed is to suppose that the price of  $x$  increases and the substitution effect increases demand for  $x$ . Draw the pivoted budget and notice that the new bundle would have to be a bundle that was previously rejected in favor of the old bundle. Since the pivoted budget still allows the old purchase, the weak axiom of revealed preference would be violated.

**8.3** Draw two different diagrams, one illustrating the Slutsky version of income and substitution effects and the other illustrating the Hicks version of income and substitution effects. How do these two notions differ?

*Answer:* The diagrams can be found in Varian's book. The Slutsky version of the substitution effect has income adjusted so the consumer is just able to afford the old bundle at the new prices. The Hicks version has the consumer's income adjusted so is exactly as well off as he was at the old prices.

**8.5** Suggest at least one reason why it might be worth the trouble it takes to learn how to decompose the effects of a price change into an income effect and a substitution effect.

*Answer:* The substitution effect of a price increase must decrease demand for that good. We know that if demand for the good increases as income increases, then the income effect works in the same direction as the substitution effect. Therefore the decomposition into income and substitution effects allows one to prove that the demand curve slopes down whenever the Engel curve slopes up. A second reason is that someone who has already purchased his planned consumption bundle faces only a substitution effect and not an income effect when prices change, since in this case his budget line just pivots around the current consumption.

**9.28** Gladys Goodhands is an insurance agent. She must choose one and only one of two possible alternative jobs. She can either work for a large national insurance company for which she must work exactly 40 hours a week and will receive a salary of  $S$  dollars per week, or she can work as an independent insurance agent, in which case she can work exactly as many hours per week as she wishes and will earn  $w$  dollars for every hour that she works. Gladys satisfies the weak axiom of revealed preference and she cares only about how much money she makes and about how much leisure time she has. Which of the following statements is necessarily true?

- (a) If  $(S/40) > w$ , she will prefer to work for the large national insurance company.
  - (b) If  $(S/40) < w$  and she decides to work independently, then it must be that she chooses to work more than 40 hours a week.
  - (c) If  $(S/40) < w$  and she decides to work independently, then it must be that she chooses to work less than 40 hours a week.
  - (d) If  $(S/40) = w$ , she will be indifferent between working for the large insurance company and working independently.
  - (e) None of the above.
-

**9.41** Mr. Cog has 18 hours per day to divide between labor and leisure. His utility function is  $U(C, R) = CR$ , where  $C$  is dollars per year spent on consumption and  $R$  is hours of leisure. If he has 19 dollars of nonlabor income per day and gets a wage rate of 15 dollars per hour when he works, his budget equation, expressing combinations of consumption and leisure that he can afford to have, can be written as:

- (a)  $15R + C = 19$ .
  - (b)  $15R + C = 289$ .
  - (c)  $R + C/15 = 379$ .
  - (d)  $C = 289 + 15R$ .
  - (e)  $C = 346 + 15R$ .
-

**9.45** Ollie South has an endowment of 10 guns and 10 pounds of butter. He can buy or sell butter at \$1 a pound. But the world market for guns is more complicated: he can buy guns for \$5 each, but he can sell guns for only \$2. If we graph his budget line with guns on the horizontal axis and butter on the vertical axis, then Ollie's budget line is:

- (a) a straight line joining (12, 0) and (0, 30).
  - (b) a straight line joining (14, 0) and (0, 14).
  - (c) a straight line with slope  $-2/5$  through the point (10, 10).
  - (d) a straight line with slope  $-5/2$  going through the point (10, 10).
  - (e) none of the above.
-

Correct Answer: A

**9.47** A farmer gets 20 eggs and 10 tomatoes every week from her chickens and her tomato plants. She has no other source of income. She has convex, downward-sloping indifference curves. The current market prices are \$2 per egg and \$3 per tomato. At these prices she chooses the same bundle that she is endowed with (20 eggs and 10 tomatoes).

(a) If relative prices change in any way whatsoever, she will certainly be no worse off and may be better off than she was before the price change.

(b) An increase in the price of eggs (with the price of tomatoes remaining constant) will decrease her utility.

(c) An increase in the price of tomatoes (with the price of eggs remaining constant) will make her worse off.

(d) If both prices rise, she will be worse off, but if only one price rises she might be made better off or worse off, depending on her tastes.

(e) Since she earns her income from tomatoes and eggs only, she treats eggs and tomatoes as perfect substitutes.

**9.1** Mr. and Mrs. Brauer owned their own home. There was a real estate boom in their town and the price of house doubled. Their income and other prices stayed constant. The Brauer's complained that "we are being driven from our home, we can't afford to live here any more". a) Draw a diagram that illustrates what happened to the Brauer's budget constraint. b) Could they have been made worse off by the change? Could they have been made better off? Explain why or why not.

*Answer:* A good diagram would show their budget line between housing and other goods pivoting around their current consumption. They can't be made worse off because they can still afford their old consumption bundle. They might be better off because they might choose to consume less housing and more other goods.

**9.3** Is it ever possible that if someone is a net seller of a good, and the price of the good he sells falls, the consumer could wind up better off than he was before by switching from being a seller to being a buyer? Draw a graph to justify your answer.

*Answer:* Yes, it is possible. For example, one can draw a budget line and an indifference curve for a person who is a net seller of the good on the horizontal axis. The price decrease pivots the budget line around his initial endowment which is located below and to the right of his consumption. Draw the pivoted line so that it crosses the indifference curve. The consumer can now benefit by becoming a net buyer of the good on the horizontal axis.

**9.11** Lucetta changes light bulbs. She is paid \$10 an hour. She can work as many hours as she wishes. Lucetta works only 6 hours a day. But she says she loves her job and is happier working at this job than she would be if she made the same income without working at all. Though this may sound strange, Lucetta is perfectly rational. Draw a graph showing leisure on the horizontal axis and income on the vertical axis. Draw a budget line and some indifference curves for Lucetta that are consistent with Lucetta's words and actions. Explain in words what happens.

*Answer:* Work for Lucetta is desirable on average but undesirable at the margin when she is working 6 hours a day. The diagram will work if you draw a U-shaped indifference curve tangent to her budget line at 6 hours. Make sure that this indifference curve intersects the horizontal line through her consumption choice somewhere to the right of her choice but to the left of where she doesn't work at all.

**10.14** In an isolated mountain village, the only crop is corn. Villagers plan for two time periods. In the first time period each villager will harvest 100 bushels. In the second time period, no corn will be harvested. There is no trade with the rest of the world and no stocks of corn remain from before the first period. Corn can be stored from one time period to the next, but rats eat 25% of what is stored. The villagers all have Cobb-Douglas utility functions  $U(C_1, C_2) = C_1 C_2$  and can allocate their own corn between consumption and storage as they wish. If the introduction of cats to the village reduces the rats' predations to 10% of what is stored:

- (a) consumption in the first time period will not change.
  - (b) villagers will consume 5% more corn in each time period.
  - (c) consumption in the first time period will increase, but by less than 5%.
  - (d) consumption in the second time period would not change.
  - (e) consumption in the first time period will decrease.

**10.1** Ophelia says "If I could lend money at the rates I must pay to borrow, I would. And if I could borrow money at the rates I receive when I lend, I would again. But forsooth, although I spend, I neither borrow nor lend." Contrary to common belief, Ophelia is entirely rational. Draw a diagram to show how Ophelia's remarks can be consistent with rational behavior and smooth convex preferences if she pays a different interest rate when she borrows than she gets when she lends. Explain what happens in words.

*Answer:* Ophelia's budget between current and future consumption is kinked at the point where her consumption in each period equals her income. The highest indifference curve to touch her budget touches at the kink. The extensions of each of the lines that meet at the kink pass above this indifference curve for a ways. These lines are the lines she could move along if she could borrow at the lending rate and lend at the borrowing rate, respectively.

**11.1** Vincent Smudge's paintings are unappreciated now. Nobody is willing to pay anything to have them on the walls. In 5 years Smudge's work will gain enduring popularity. People will suddenly be willing to pay \$1,000 a year to have an original Smudge on their walls and will continue to be willing to do so ever after. If investors realize that this is the case, and if the interest rate is and always will be  $r$ , a painting by Smudge will currently be worth about:

- (a)  $\$(1000/r)[1/(1+r)^4]$ .
  - (b)  $\$1000/r - 5000/r$ .
  - (c)  $\$1000(1+r)^5$ .
  - (d)  $\$1000(1/r)^5$ .
  - (e)  $\$200/r$ .

**11.5** The interest rate is 10%. A certain piece of land can be used either for a parking lot, in which case there are no construction costs and it will yield a net return of \$5,000 per year forever starting one year from now. Or it can have a house built on it. Building a house would cost \$50,000 now. If a house is built on the lot, it will yield a stream of net income equal to \$12,000 per year starting one year from now. No other uses are contemplated. The theory of asset markets predicts that the lot will:

- (a) sell for \$120,000 and a house will be built on it.
  - (b) sell for \$50,000 and a parking lot will be built on it.
  - (c) sell for \$70,000 and a house will be built on it.
  - (d) sell for \$13,200 and a house will be built on it.
  - (e) sell for \$80,000 and a parking lot will be built on it.
-

**11.1** The interest rate is 10% and will remain 10% forever. Suppose that you do not drink wine but are interested in buying it for investment purposes. How much would you be willing to pay for each of the following? (i) A bottle of wine that will be worth \$22 a year from now and will then go bad and be worthless. (ii) A bottle of wine that will be worth \$22 a year from now and will rise in value by \$1 a year forever? Explain your answer.

*Answer:* Both are worth \$20. Each will be sold and drunk in 1 year. The increase in value of \$1 per year on a \$22 bottle of wine is not a high enough rate of return for anyone to want to hold it another year.

**11.2** A certain wine costs \$3 a bottle to produce. The amount that people are willing to pay to drink it  $t$  years after it has been bottled is  $\$2 + 3t$ . Storage costs, not including interest, are \$.50 per year. If the interest rate is 5%, how much would a rational investor be willing to pay for it at the time it is bottled? Explain how you get your answer. Feel free to write formulas for present value calculations without working out the numerical answer if it involves long calculations. (Hint: How long would the wine be kept before it is drunk? At what price would it sell?)

*Answer:* Wine would be kept for 16 years and sold for \$50. The present value of this is  $50/(1.05)^{16}$ . From this number we have to subtract the present value of storage costs which is the present value of paying \$.50 a year for 16 years. This is the cost of paying \$.50 a year forever, starting now minus the cost of paying \$.50 a year forever starting in 16 years or  $\$.50(1/r)(1 - 1/(1+r)^{16})$ .

**11.3** Suppose that the cost of personal computers falls by 20% per year. To make this problem relatively easy, we will assume that their quality does not change and that computers never wear out. You plan to get one sometime. What is the rational way to decide when to buy one?

*Answer:* Figure out what it is worth to you to have the computer for one year. Notice that the cost to you of having it is approximately the difference between the price of a computer at the beginning of the year and the price at the end of the year. If the value to you is  $V$  and the current price is  $P$ , you buy if  $V > .2P$ . Otherwise you wait. Eventually,  $.2P$  will be smaller than  $V$ . Then you buy.

**11.4** According to a recent story in the New York Times, the South African gold strike has been costing South African mining companies about \$7.5 million per day. Assuming that this number is the value of the gold that was not mined because of the strike, minus the labor costs (and other operating costs) that are saved by shutting down the mines, what is wrong with this calculation?

*Answer:* The gold that is not mined now will still be there and can be extracted later. The figure that was reached would be the cost if the gold that would have been mined had somehow been destroyed by the strike. The actual costs would be more closely measured by the interest cost of postponement of the net revenues from the gold mines until the strike is settled.

**12.8** Mabel and Emil were contemplating marriage. They got to talking. Mabel said that she always acted according to the expected utility hypothesis, where she tried to maximize the expected value of the log of her income. Emil said that he too was an expected utility maximizer, but he tried to maximize the expected value of the square of his income. Mabel said, "I fear we must part. Our attitudes toward risk are too different." Emil said, "Never fear, my dear, the square of income is a monotonic increasing function of the log of income, so we really have the same preferences." Who is right about whether their preferences toward risk are different?

- (a) Mabel is right.
  - (b) Emil is right.
  - (c) Emil is right about small risks, but wrong about large risks.
  - (d) Mabel is right about small risks, but wrong about large risks.
  - (e) They are both wrong.
-

**12.1** Gaston Gourmand loves good food. Due to an unusual ailment, he has a probability of  $1/4$  of losing his sense of smell, which would greatly reduce his enjoyment of food. Gaston finds an insurance company that will sell him "insurance" where he gets  $\$3x$  if he loses his smell and pays  $\$x$  if he doesn't. He can also buy "negative insurance" where he pays  $\$3x$  if he loses his sense of smell and gets  $x$  dollars if he doesn't. Gaston says, "Money will be only half as important to me if I lose my sense of smell." If we look at his expected utility function, we see what he means. Where  $c_1$  is his consumption if he retains his sense of smell and  $c_2$  is his income if he loses his sense of smell, Gaston has the expected utility function  $U(c_1, c_2) = 3/4c_1^{1/2} + 1/8c_2^{1/2}$ . What insurance should he buy?

*Answer:* Negative insurance so that his wealth is 4 times as large if he doesn't lose his smell than if he does.

**12.2** Oliver takes his wealth of  $\$1000$  to a casino. He can bet as much as he likes on the toss of a coin, but the "house" takes a cut. If Oliver bets  $\$x$  on heads, then if heads comes up, he gets  $\$.8x$ , and if tails comes up he pays  $\$x$ . Similarly if he bets  $\$x$  on tails and if tails comes up, he wins  $\$.8x$ , and if heads comes up he pays  $\$x$ . Draw a graph with dollars contingent on heads and dollars contingent on tails on the two axes. Show Oliver's budget constraint. Oliver is an expected utility maximizer with the utility function  $U(h, t) = 1/2h^2 + 1/2t^2$  where  $h$  is his wealth if heads comes up and  $t$  is his wealth if tails comes up. Draw the highest indifference curve that Oliver can reach with his budget. What bets if any does he make?

*Answer:* Budget kinks at  $(1000, 1000)$ ; it meets the axes at  $(1800, 0)$  and  $(0, 1800)$ . Indifference curves are quarter circles. Oliver will gamble his entire wealth, either betting it all on heads or all on tails.

**12.3** Linus Piecewise is an expected utility maximizer. There are two events,  $H$  and  $T$ , which each have probability  $1/2$ . Linus's preferences over lotteries in which his wealth is  $h$  if Event  $H$  happens and  $t$  if Event  $T$  happens are representable by the utility function  $U(h, t) = u(h)/2 + u(t)/2$ . The function  $u$  takes the following form. For any  $x$ ,  $u(x) = x$  if  $x < 100$  and  $u(x) = 100 + x/2$  if  $x$  is greater than or equal to 100. Draw a graph showing the indifference curves for Linus that pass through a) the point  $(50, 0)$  b) the point  $(50, 100)$  c) the point  $(100, 100)$  d) the point  $(150, 100)$ .

*Answer:* Curve a is a line with slope  $-1$ . Curve b has 3 linear segments: a line from  $(100, 50)$  to  $(50, 100)$ , a line with slope  $-2$  to the left of  $(50, 100)$ , and a line with slope  $-1/2$  to the right of  $(100, 50)$ . Curve c has two segments: a line with slope  $-2$  going to the left and a line with slope  $-1/2$  to the right of  $(100, 100)$ . Curve d has 3 segments, a line from  $(150, 100)$  to  $(100, 150)$ , and lines from  $(150, 100)$  to  $(200, 0)$  and from  $(0, 200)$  to  $(100, 150)$ .

**15.36** In a certain city, the demand function for crack cocaine is  $q = 1000 - p$  where  $p$  is the "street price". The cocaine industry is competitive. Cocaine distributors can buy as much cocaine as they wish at a price of \$50 per unit from Colombian sources. Whenever the city narcotics police catch a cocaine dealer, they confiscate all the cocaine that he has. The jails are full so they do not imprison the dealers. The police are able to catch the dealers about half the time, so they get about half the cocaine that enters the city. Instead of destroying confiscated crack, the police simply resell it on the street. If the original supply curve of cocaine on the streets was horizontal, what is the net effect of police activities on the market for crack in this city?

- (a) The amount purchased on the street is about 50 units smaller than it would be with no enforcement.
  - (b) There is no effect, since all of the drugs reach consumers anyway.
  - (c) Crack dealers will stop dealing in this city altogether, since they can make more money elsewhere.
  - (d) The amount of crack purchased on the street decreases by about half.
  - (e) The quantity purchased by dealers rises to make up for the amount that is confiscated.

**15.37** If at current prices, the demand for a good is price-elastic, then for movements along the demand curve:

- (a) increasing the price will increase revenue.
  - (b) decreasing the price will decrease revenue.
  - (c) increasing the quantity sold will increase revenue.
  - (d) increasing the quantity sold will decrease revenue.
  - (e) More than one of the above statements are true.
-

**15.38** The demand curve for a good is given by  $p = 140 - 8q$  where  $p$  is the price and  $q$  is the quantity of the good. Suppose that the number of consumers in the economy doubles, with a "clone" appearing for each consumer, who has exactly the same demand curve as the original consumer. The demand curve for the doubled economy is described by:

- (a)  $p = 280 - 8q$ .
  - (b)  $p = 280 - 16q$ .
  - (c)  $p = 140 - 16q$ .
  - (d)  $p = 140 - 4q$ .
  - (e)  $p = 70 - 4q$ .

**15.2** Bart Wurst runs the only hotdog stand in a large park in a large boring town. On Sundays people in this town all sit in the park and sunbathe. For any  $t$  between 0 and 30, the number of people who are sitting within  $t$  minutes of Bart's stand is  $10t^2$ . People in Bart's town are lazy and hate to walk. They think that every minute of walking they do is as bad as spending \$.10. Everybody in the park has a reservation price of \$1 for a hot dog where the cost of a hot dog includes the subjective cost of walking as well as the money price they have to pay when they get there. (Nobody has ever thought of fetching a hot dog for someone else.) Find a formula for the demand curve for Bart's hot dogs. Explain how you got it.

*Answer:* If Bart charges  $p$  where  $0 < p < 1$ , his extensive margin is the customers who are at distance  $t^*$  from Bart where  $p + .10t^* = 1$ . Then  $t^* = 10 - p$  and the demand for hot dogs at prices  $p$  is the number,  $(10 - p)^2$ , of people within  $t^*$  of Bart.

**15.3** In Tassel, Illinois ( $pop, 20,000$ ), there are two kinds of families, those who like swimming pools and those who don't. Half of the population is of each type. Families who like swimming pools are willing to spend up to 5% of their income each year on a swimming pool. Families who don't like them would pay nothing for a swimming pool. Nobody wants more than one swimming pool and nobody has thought of sharing a swimming pool. Incomes in Tassel range between \$10,000 and \$110,000. For incomes,  $M$ , in this range, the number of families in Tassel with income greater than  $M$  is about  $22,000 - .2M$ . (The two types of families have the same income distribution.) Find the aggregate demand function for swimming pools in Tassel (demand for swimming pools as a function of annual cost of having one).

*Answer:* The number of people willing to pay at least  $p$  is half of the number who have income at least  $20p$ . Therefore the aggregate demand function is  $11,000 - 2p$ .

**15.4** Ethel is trying to decide whether to have 0 cars, 1 car, or 2 cars. If  $x$  is the number of cars she has and  $y$  is the amount of money she has per year to spend on other stuff, Ethel's utility function is  $U(x, y)$  where  $U(0, y) = y^{1/2}$ ,  $U(1, y) = (15/14)y^{1/2}$ , and  $U(2, y) = (10/9)y^{1/2}$ . Suppose that it costs \$2000 a year to have 1 car and \$4000 a year to have 2 cars. Ethel finds that the right thing to do depends on her income. What is her willingness to pay for 1 car if her income is  $M$ ? What is the lowest income at which she would have a car? What is the lowest income at which she would have 2 cars?

*Answer:* Her willingness to pay for 1 car is about  $.129M$  where  $M$  is her income. The lowest income at which she would get a car is \$15,504. If we solve the equation  $U(1, y - 2000) = U(2, y - 4000)$  we find \$55,143. At incomes above that she prefers 2 cars; below that she would be better off to have 1 car.

**16.8** The demand curve, which is a downward-sloping straight line, crosses the supply curve, which is an upward-sloping straight line. If a tax is introduced where sellers must pay a tax of \$2 per unit sold, then the equilibrium price paid by demanders will rise by more than \$1 if the absolute value of the slope of the demand curve is greater than the absolute value of the slope of the supply curve.

**16.37**

Daily demand for gasoline at Billy-Bob's Mobile Station is described by  $Q = 776 - 200p$  where  $Q$  are gallons of gasoline sold and  $p$  is the price in dollars. Billy-Bob's supply is  $Q = -890 + 1,500p$ . Suppose the state government places a tax of 20 cents on every gallon of gasoline sold. What is the deadweight loss resulting from this tax?

- (a) 3.53 dollars.
- (b) 3.11 dollars.
- (c) 0.42 dollars.
- (d) 96.12 dollars.
- (e) 34.59 dollars.

**16.1** Use supply and demand analysis to examine the following statement: "The practice of giving food stamps is self-defeating. Food stamps effectively lower the price of food. When food becomes available at lower prices, demand will increase thereby forcing the price up to its initial level." Is this reasoning correct? Draw supply and demand curves to illustrate your answer.

*Answer:* The subsidy would shift the demand curve to the right, much as the quotation says, but if the supply curve slopes up, then the new equilibrium should take place with a greater supply and a lower net price for those who use food stamps. The market price will rise, but not by the full amount of the discount one gets with food stamps.

**16.2** Long ago, a kindly prince noticed the misery of his subjects. His subjects all had the same preferences and the same low incomes. The demand function of each subject for bread was  $q = 26 - p$  where  $p$  is the price of bread and  $q$  is the number of loaves per week. The supply of bread per capita per week was given by the function  $q = .3p$ . The king declared since his subjects did not even get a loaf of bread per day, he would help them by making it illegal to sell bread for more than 10 groschens per loaf. Unhappily, a bread shortage arose and people waited in long lines to get bread. a) Draw a graph to show why. Put numerical labels on the important points on your graph. b) If the citizens could earn 4 groschens per hour at work that was exactly as unpleasant as waiting in line, what would be the equilibrium waiting time for a loaf of bread?

*Answer:* b) 3.25 Hours.

**17.1** A first-edition of Adam Smith's *Wealth of Nations* (published in 1776) is being auctioned via the internet. The current owner starts by posting his own "bid" for it. Bidders are allowed to submit bids at any time during a one-week interval. For the following week, bids will be accepted only if they exceed the currently posted high bid. Throughout the week, the highest bid that anyone has made so far will be posted. At the end of the week, the book will be sold to the highest bidder at the price that he or she bid for it. Assuming that bidders understand the rules of the auction, the outcome of this auction will be similar to that for

- (a) an English auction with a reserve price equal to the owner's bid.
  - (b) a Dutch auction with a reserve price equal to the owner's bid.
  - (c) a sealed-bid auction in which the book is sold to the highest bidder at the highest bidder's bid price.
  - (d) a common-value auction.
  - (e) an English auction with no reserve price.
-

**17.2** A stamp dealer is holding an auction for an English Penny Black postage stamp, issued in 1840. Potential buyers are asked to submit written bids for this stamp, and it will be sold to the highest bidder at a price equal to the bid submitted by the second-highest bidder. If bidders understand the logic of this auction and bid in their own self-interest,

- (a) bidders will shade their bids by approximately 10 percent, and hence the stamp will be sold for about 10 percent less than the second-highest willingness to pay.
  - (b) bidders will bid more than their true valuation, since they only have to pay the second-highest bid and not their own bid.
  - (c) bidders will bid exactly their true valuation.
  - (d) the highest bidder will overstate his valuation and the second-highest bidder will understate his valuation.
  - (e) bidders will all bid  $(n - 1/n)$  of their true valuations, where  $n$  is the number of bidders.

**17.22** A dealer decides to sell an oil painting by means of an English auction with a reservation price just slightly below \$63,000. If he fails to get his reservation price for the painting, he will burn it. There are two bidders. The dealer believes that there are only three possible values, \$108,000, \$63,000, and \$27,000, that each bidder's willingness to pay might take. Each bidder has a probability of  $1/3$  of having each of these willingnesses to pay, and the probabilities for each of the two bidders are independent of the other's valuation. Assuming that the two bidders bid rationally and do not collude, the dealer's expected revenue from selling the painting is slightly less than

- (a) \$61,000.
  - (b) \$63,000.
  - (c) \$27,000.
  - (d) \$45,000.
  - (e) \$66,000.

**17.23** Herb's Auction House in Purloined Hubcap, Oregon, holds sealed-bid used-car auctions every Wednesday. Each car is sold to the highest bidder at the second-highest bidder's bid. On average, two-thirds of the cars that are auctioned are lemons and one-third are good used cars. A good car is worth \$1,500 to any buyer. A lemon is worth only \$150 to a buyer. Most buyers can do no better than random at picking good cars from the lot. There is only one exception, Al Crankcase. Al can sometimes but not always detect lemons by means of a subtle test. A good car will never fail Al's test, but approximately half of the lemons fail his test. Al attends every auction, tests every car, and always bids his expected value. Normal bidders bid less than the expected value for a randomly selected car but more than the value of a lemon.

- (a) Al will bid \$825 for cars that pass his test and \$150 for cars that fail his test. Normal bidders will get only lemons.
- (b) Al will bid \$750 for cars that pass his test and \$500 for cars that fail his test. Normal bidders will get only lemons
- (c) Al will bid \$500 for cars that pass his test and \$150 for cars that fail his test. Normal bidders will get good cars only 1/6 of the time.
- (d) Al will bid \$600 for cars that pass his test and \$250 for cars that fail his test. Normal bidders will get good cars only 1/6 of the time.
- (e) Al will bid \$300 for cars that pass his test and \$150 for cars that fail his test. Normal bidders will get good cars 1/12 of the time.

**17.24** A seller knows that there are two bidders for the object she is selling. She believes that with probability 1/2, one has a buyer value of \$5 and the other has a buyer value of \$10 and, with probability 1/2, one has a buyer value of \$8 and the other has a buyer value of \$15. She knows that bidders will want to buy the object so long as they can get it for their buyer value or less. She sells it in an English auction with a reserve price which she must set before the auction starts. To maximize her expected profits, she should set the reserve price at

- (a) \$5.
- (b) \$10.
- (c) \$8.
- (d) \$13.
- (e) \$15.

% Correct Responses: 75  
Correct Answer: True

Difficulty: 2  
Discrimination Index: 27

**18.13** If there is one input used in production and if there are decreasing returns to scale, then the marginal product for the input will be diminishing.

---

Topic: Technology  
% Correct Responses: 92  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 7

**18.14** A firm's production function is  $f(x_1, x_2) = x_1 + 2x_2$ . This means that  $x_2$  is twice as expensive as  $x_1$ .

---

Topic: Technology  
% Correct Responses: 75  
Correct Answer: True

Difficulty: 2  
Discrimination Index: 20

**18.15** A firm has two variable factors and a production function  $f(x_1, x_2) = (2x_1 + 4x_2)^{1/2}$ . The technical rate of substitution between  $x_1$  and  $x_2$  is constant.

---

Topic: Technology  
% Correct Responses: 38  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 8

**18.16** If the marginal product of each factor decreases as the amount of that factor used increases, then there must be decreasing returns to scale.

---

Topic: Technology  
% Correct Responses: 92  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 13

**18.1** In any production process, the marginal product of labor equals:

- (a) the value of total output minus the cost of the fixed capital stock.
  - (b) the change in output per unit change in labor input for “small” changes in the amount of input.
  - (c) total output divided by total labor inputs.
  - (d) total output produced with the given labor inputs.
  - (e) the average output of the least skilled workers employed by the firm.
- 

Topic: Technology  
% Correct Responses: 67  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 41

**18.2** If a firm moves from one point on a production isoquant to another point on the same isoquant, which of the following will certainly NOT happen?

- (a) a change in the level of output
  - (b) a change in the ratio in which the inputs are combined
  - (c) a change in the marginal products of the inputs
  - (d) a change in the rate of technical substitution
  - (e) a change in profitability
- 

Topic: Technology  
% Correct Responses: 0  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 0

**18.3** A firm has the production function  $f(x, y) = x^5 + y$  where  $x$  is the amount of factor  $x$  it uses and  $y$  is the amount of factor  $y$ . On a diagram we put  $x$  on the horizontal axis and  $y$  on the vertical axis. We draw some isoquants. Now we draw a straight line on the graph and we notice that the slopes of all the isoquants that it meets have the same slope at the point where they meet this line. The straight line we drew was:

- (a) vertical.
  - (b) horizontal.
  - (c) diagonal through the origin with slope .5.
  - (d) diagonal with slope 2.
  - (e) diagonal with slope greater than 2.
-

---

Topic: Technology  
% Correct Responses: 72  
Correct Answer: E

Difficulty: 2  
Discrimination Index: 24

**18.4** Which of the following production functions exhibit constant returns to scale? In each case  $y$  is output and  $K$  and  $L$  are inputs. (1)  $y = K^{1/2}L^{2/3}$  (2)  $y = 3K^{1/2}L^{1/2}$  (3)  $y = K^{1/2} + L^{1/2}$  (4)  $y = 2K + 3L$ .

- (a) 1,2, and 4
  - (b) 2,3, and 4
  - (c) 1,3, and 4
  - (d) 2 and 3
  - (e) 2 and 4
-

Correct Answer: C

Difficulty: 1  
Discrimination Index: 11

**18.7** A firm uses only two inputs to produce its output. These inputs are perfect substitutes. This firm:

- (a) must have increasing returns to scale.
  - (b) must have constant returns to scale.
  - (c) could have increasing returns to scale, constant returns to scale, or decreasing returns to scale.
  - (d) must have decreasing returns to scale.
  - (e) must have decreasing returns to scale in the short run and constant returns to scale in the long run.
- 

Topic: Technology  
% Correct Responses: 0  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 0

**18.8** A firm has the production function  $f(X, Y) = X^{3/4}Y^{1/4}$  where  $X$  is the amount of factor  $x$  used and  $Y$  is the amount of factor  $y$  used. On a diagram we put  $X$  on the horizontal axis and  $Y$  on the vertical axis. We draw some isoquants. Now we draw a straight line on the graph and we notice that wherever this line meets an isoquant, the isoquant has a slope of  $-3$ . The straight line we drew:

- (a) is vertical.
  - (b) is horizontal.
  - (c) is a ray through the origin with slope 1.
  - (d) is a ray through the origin with slope 2.
  - (e) has a negative slope.
- 

Topic: Technology  
% Correct Responses: 0  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 0

**18.9** A firm has the production function  $f(X, Y) = X^{2/3}Y^{1/3}$  where  $X$  is the amount of factor  $x$  used and  $Y$  is the amount of factor  $y$  used. On a diagram we put  $X$  on the horizontal axis and  $Y$  on the vertical axis. We draw some isoquants. Now we draw a straight line on the graph and we notice that wherever this line meets an isoquant, the isoquant has a slope of  $-4$ . The straight line we drew:

- (a) is vertical.
  - (b) is horizontal.
  - (c) is a ray through the origin with slope 2.
  - (d) is a ray through the origin with slope 3.
  - (e) has a negative slope.
-

Topic: Technology

**18.1** On separate axes, draw typical production isoquants for each of the following production functions. a)  $f(x, y) = \min\{2x, x + y\}$  b)  $f(x, y) = xy$  c)  $f(x, y) = x + \min\{x, y\}$  d)  $f(x, y) = x + y^{1/2}$ .

*Answer:* For a), the isoquants have a kink at the line  $x = y$ . At a typical point on this line, say  $x = y = 3$ , the isoquant has a vertical segment going all the way to the sky and another segment running from (3, 3) to (6, 0). b) These are rectangular hyperbolas. c) If  $x$  is on the horizontal axis and  $y$  on the vertical axis, an isoquant has a kink on the line  $x = y$ . To the left of this line, an isoquant has the slope  $-1$ , to the right of this line, an isoquant has slope  $-1$ . Above this line the isoquant is vertical. d) The isoquants are convex to the origin. If you draw a horizontal line through two or more isoquants, they will all have the same slope where they meet this line.

## *True-False*

## Profit Maximization

---

Topic: Profit Maximization  
% Correct Responses: 96  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 25

**19.1** The weak axiom of profit maximizing behavior states that in a modern mixed economy, firms have only a weak incentive to maximize profits.

---

Topic: Profit Maximization  
% Correct Responses: 86  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 30

**19.2** A fixed factor is a factor of production that is used in fixed proportion to the level of output.

---

Topic: Profit Maximization  
% Correct Responses: 92  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 7

**19.3** The marginal product of a factor is just the derivative of the production function with respect to the amount of this factor, holding the amounts of other factor inputs constant.

---

Topic: Profit Maximization  
% Correct Responses: 37  
Correct Answer: False

Difficulty: 2  
Discrimination Index: 19

**19.4** If the value of the marginal product of factor  $x$  increases as the quantity of  $x$  increases, and the value of the marginal product of  $x$  is equal to the wage rate, then the profit maximizing amount of  $x$  is being used.

---

Topic: Profit Maximization  
% Correct Responses: 43  
Correct Answer: True

Difficulty: 2  
Discrimination Index: 45

**19.5** If the price of the output of a profit-maximizing, competitive firm rises and all other prices stay constant, then the firm's output cannot fall.

---

---

Topic: Profit Maximization Difficulty: 1  
 % Correct Responses: 78 Discrimination Index: 12  
 Correct Answer: True

**19.6** If a profit-maximizing competitive firm has constant returns to scale, then its long run profits must be zero.

---

Topic: Profit Maximization Difficulty: 2  
 % Correct Responses: 58 Discrimination Index: 17  
 Correct Answer: False

**19.7** Just as in the theory of utility maximizing consumers, the theory of profit maximizing firms allows the possibility of "Giffen factors". These are factors for which a fall in price leads to a fall in demand.

---

Topic: Profit Maximization Difficulty: 1  
 % Correct Responses: 92 Discrimination Index: 15  
 Correct Answer: False

**19.8** If the value of the marginal product of labor exceeds the wage rate, then a competitive, profit-maximizing firm would want to hire less labor.

---

Topic: Profit Maximization Difficulty: 2  
 % Correct Responses: 63 Discrimination Index: 40  
 Correct Answer: False

**19.9** A firm produces one input with one output and has decreasing returns to scale. The price that it pays per unit of input and the price it gets per unit of output are independent of the amount that this firm buys or sells. If the government taxes its net profits at some percentage rate and subsidizes its inputs at the same percentage rate, the firm's profit maximizing output will not change.

---

---

Topic: Profit Maximization

Difficulty: 2

% Correct Responses: 81

Discrimination Index: 36

Correct Answer: D

**19.1** A competitive firm produces output using three fixed factors and one variable factor. The firm's short run production function is  $q = 163x - 2x^2$ , where  $x$  is the amount of variable factor used. The price of output is \$3 per unit and the price of the variable factor is \$9 per unit. In the short run, how many units of  $x$  should the firm use?

- (a) 20
  - (b) 80
  - (c) 19
  - (d) 40
  - (e) None of the above.
-

Difficulty: 2

% Correct Responses: 81

Discrimination Index: 36

Correct Answer: D

**19.2** A competitive firm produces output using three fixed factors and one variable factor. The firm's short run production function is  $q = 455x - 5x^2$ , where  $x$  is the amount of variable factor used. The price of output is \$3 per unit and the price of the variable factor is \$15 per unit. In the short run, how many units of  $x$  should the firm use?

- (a) 22
  - (b) 90
  - (c) 31
  - (d) 45
  - (e) None of the above.
-

---

Topic: Profit Maximization  
% Correct Responses: 69  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 50

**19.3** A competitive firm produces a single output using several inputs. The price of output rises by \$2 per unit. The price of one of the inputs increases by \$5 and the quantity of this input that the firm uses increases by 6 units. The prices of all other inputs stay unchanged. From the weak axiom of profit maximization we can tell that:

- (a) the output of the good must have increased by at least 15 units.
  - (b) the inputs of the other factors must have stayed constant.
  - (c) the output of the good must have decreased by at least 7.50 units.
  - (d) the inputs of at least one of the other factors must have decreased by at least 6 units.
  - (e) the inputs of at least one of the other factors must have increased by at least 6 units.
-

Correct Answer: E

Difficulty: 2  
Discrimination Index: 17

**19.5** If there is perfect certainty, a competitive firm will necessarily:

- (a) seek to maximize its immediate profits rather than long run returns because otherwise it will go broke.
  - (b) maximize the ratio of the present value of its sales to the present value of its costs.
  - (c) equalize its profits in all periods.
  - (d) equalize its sales in all periods.
  - (e) None of the above.
-

---

Topic: Profit Maximization  
% Correct Responses: 55  
Correct Answer: B

Difficulty: 2  
Discrimination Index: 37

**19.6** A firm produces one output using one input. When the cost of the input was 3 and the price of the output was 3, the firm used 6 units of input to produce 18 units of output. Later, when the cost of the input was 7 and the price of the output was 4, the firm used 5 units of input to produce 20 units of output.

- (a) This behavior is consistent with WAPM.
  - (b) This behavior is not consistent with WAPM.
  - (c) This behavior is impossible no matter what the firm is trying to do.
  - (d) This behavior suggests the presence of increasing returns to scale.
  - (e) This behavior suggests the presence of decreasing returns to scale.
- 

Topic: Profit Maximization

**19.1** A competitive firm has a production function described as follows. "Weekly output is the square root of the minimum of the number of units of capital and the number of units of labor employed per week." Suppose that in the short run this firm must use 16 units of capital but can vary its amount of labor freely. a) Write down a formula that describes the marginal product of labor in the short run as a function of the amount of labor used. (Be careful at the boundaries.) b) If the wage is  $w = 1$  and the price of output is  $p = 4$ , how much labor will the firm demand in the short run? c) What if  $w = 1$  and  $p = 10$ ? d) Write down an equation for the firm's short run demand for labor as function of  $w$  and  $p$ .

*Answer:* a)  $MP = 1/(2L^{1/2})$  if  $L < 16$ ,  $MP = 0$  if  $L > 16$ . b) 4 c) 16 d)  $L = (p/2w)^2$

**20.11** As head of the planning commission of Eastern Motors, your job is to determine where to locate a new plant. The only inputs used in your cars are steel and labor and the production function is Cobb-Douglas where  $f(S, L) = S^{.5}L^{.5}$  where  $S$  is tons of steel and  $L$  is units of labor. You can locate your plant either in country A or country B. In country A, steel costs \$7 (U.S.) a ton and labor costs \$7 (U.S.) per unit. In country B, steel costs \$8 (U.S.) per ton and labor costs \$6 (U.S.) per unit. In which country should the company locate its new plant so as to minimize costs per unit of output?

- (a) Country A
  - (b) Country B
  - (c) It doesn't matter, because two locations are equally costly.
  - (d) Country A if output is greater than 14, otherwise Country B.
  - (e) There is not enough information to enable us to tell.
-

**20.13** A firm has the production function  $Q = KL$  where  $K$  is the amount of capital and  $L$  is the amount of labor it uses as inputs. The cost per unit of capital is a rental fee  $r$  and the cost per unit of labor is a wage  $w$ . The conditional labor demand function,  $L(Q, w, r)$  is:

- (a)  $Qwr$ .
  - (b) the square root of  $Qr/w$ .
  - (c)  $Qw/r$ .
  - (d) the square root of  $Q/rw$ .
  - (e)  $Q/wr$ .
- 

Topic: Cost Minimization  
% Correct Responses: 60  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 32

**20.14** Joe's Bar and Grill uses two inputs, beer and pretzels. When the price of beer was \$10 a case and the price of pretzels was \$20 a case, Joe used 1 case of beer and 2 cases of pretzels a day. When the price of beer was \$20 a case and the price of pretzels was \$10 a case, Joe used 2 cases of beer and 1 case of pretzels a day. Joe produced the same output in each of these circumstances. From this information, we can conclude:

- (a) Joe has a constant returns to scale production function.
  - (b) Joe has a cost function that exhibits increasing returns.
  - (c) Joe is not minimizing costs.
  - (d) Joe's behavior is consistent with profit maximization.
  - (e) Joe's production function exhibits diminishing marginal product.
-

Correct Answer: B

Difficulty: 2  
Discrimination Index: 41

**20.18** Roberta runs a dress factory. She produces 50 dresses per day, using labor and electricity. She uses a combination of labor and electricity that produces 50 dresses per day in the cheapest possible way. She can hire as much labor as she wants at a cost of 20 cents per minute. She can use as much electricity as she wants at a cost of 10 cents per minute. Her production isoquants are smooth curves without kinks and she uses positive amounts of both inputs.

- (a) The marginal product of a kilowatt-hour of electricity is twice the marginal product of a minute of labor.
  - (b) The marginal product of a minute of labor is twice the marginal product of a kilowatt-hour of electricity.
  - (c) The marginal product of a minute of labor is equal to the marginal product of a kilowatt-hour of electricity.
  - (d) There is not enough information to determine the ratio of marginal products. We'd have to know the production function to know this.
  - (e) The marginal product of a minute of labor plus the marginal product of a kilowatt-hour of labor must equal  $50/(20 + 10)$ .
-

The editors at Snoozeweek, a news magazine, constantly alter the proportion of celebrity photographs and mundane news stories so as to maximize the number of copies sold. A statistical consultant has estimated sales to be  $S = 1,000C^{0.50}N^{0.50}$  (where  $C$  is the number of celebrity photographs and  $N$  is column inches of news stories). If the editors only have \$12,000 to spend on each edition with celebrity photos costing \$1,000 each and news stories costing \$10 per column inch, what should the editors do?

- (a) Purchase 8 celebrity photos and 400 column inches of news stories.
- (b) Purchase 6 celebrity photos and 600 column inches of news stories.
- (c) Purchase 2 celebrity photos and 1,000 column inches of news stories.
- (d) Purchase 3 celebrity photos and 900 column inches of news stories.
- (e) Purchase 5 celebrity photos and 700 column inches of news stories.

**20.60** Vincent Smudge, an avant-guard New York artist, creates “living sculpture” by smearing paint slowly all over himself.  $S$  hours of “living sculpture” can be created by

$$S = \min(L, T/5)$$

where  $L$  are hours of labor by Mr. Smudge, and  $T$  are tubes of water soluble paint. Since Mr. Smudge is a highly renowned artist, his labor costs \$50 per hour, while paint costs \$40 per tube. Using a \$3,000 grant from the National Endowment for the Arts, how many hours of “living sculpture” can Mr. Smudge create?

- (a) 33.33
- (b) 51.72
- (c) 12
- (d) 500
- (e) 2,500

# Cost Minimization

---

Topic: Cost Minimization

Difficulty: 1

% Correct Responses: 0

Discrimination Index: 0

**20.1** A firm has a production function described as follows: "Weekly output is equal to the square root of the minimum of the amount of capital and the number of hours of labor used per week." Suppose that the cost of a unit of capital is  $r$  and the price of a unit of labor is  $w$  and the level of output is  $y$ . Write down the long run total cost as a function of  $w$ ,  $r$ , and  $y$ .

*Answer:*  $c(w, r, y) = (w + r)y^2$ .

---

Topic: Cost Minimization

Difficulty: 2

% Correct Responses: 0

Discrimination Index: 0

**20.2** The production function for good  $y$  is  $y = \max\{10x_1, 4x_2\}$  where  $x_1$  and  $x_2$  are the amounts of factors 1 and 2. Find the cost function for good  $y$ .

*Answer:* The cost function is  $\min\{p_1y/10, p_2y/4\}$ .

---

# Chapter 21

## *True-False*

## Cost Curves

---

Topic: Cost Curves  
% Correct Responses: 0  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 0

**21.1** The average variable cost curve must always be  $U$  shaped.

---

Topic: Cost Curves  
% Correct Responses: 82  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 34

**21.2** The marginal cost curve passes through the minimum point of the average fixed cost curve.

---

Topic: Cost Curves  
% Correct Responses: 82  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 26

**21.3** If the average cost curve is  $U$  shaped, then the marginal cost curve must cross the average cost curve at the bottom of the  $U$ .

---

Topic: Cost Curves  
% Correct Responses: 89  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 25

**21.4** The cost function  $C(y) = 10 + 3y$  has marginal cost less than average cost for all levels of output.

---

Topic: Cost Curves  
% Correct Responses: 92  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 10

**21.5** The cost function  $C(y) = 100 + 3y^2$  has marginal cost less than average cost for all positive levels of output.

---

Topic: Cost Curves  
% Correct Responses: 78  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 28

**21.6** If a competitive firm uses two inputs and it has the production function  $F(x_1, x_2) = x_1^{1/2} + x_2^{1/2}$ , then its marginal cost curve is horizontal.

---

---

Topic: Cost Curves	Difficulty: 2
% Correct Responses: 13	Discrimination Index: 20
Correct Answer: False	

**21.7** Average cost can never rise while marginal costs are declining.

---

Topic: Cost Curves	Difficulty: 1
% Correct Responses: 89	Discrimination Index: 21
Correct Answer: False	

**21.8** The area under the marginal cost curve measures total fixed costs.

---

Topic: Cost Curves	Difficulty: 1
% Correct Responses: 80	Discrimination Index: 23
Correct Answer: False	

**21.9** If marginal costs increase as output increases, then the average fixed cost curve will be U-shaped.

---

Topic: Cost Curves	Difficulty: 1
% Correct Responses: 74	Discrimination Index: 27
Correct Answer: False	

**21.10** Average fixed cost curves will be U-shaped if the marginal cost curve is upward-sloping.

---

## Cost Curves

---

Topic: Cost Curves  
% Correct Responses: 94  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 13

**21.1** The marginal cost curve of a firm is  $MC = 8y$ . Total variable costs to produce 7 units of output are:

- (a) 112.
  - (b) 196.
  - (c) 56.
  - (d) 196.
  - (e) 22.
- 

Topic: Cost Curves  
% Correct Responses: 94  
Correct Answer: B

Difficulty: 1  
Discrimination Index: 13

**21.2** The marginal cost curve of a firm is  $MC = 6y$ . Total variable costs to produce 8 units of output are:

- (a) 96.
  - (b) 192.
  - (c) 64.
  - (d) 256.
  - (e) 22.
- 

Topic: Cost Curves  
% Correct Responses: 75  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 18

**21.3** The following relationship must hold between the average total cost (ATC) curve and the marginal cost curve (MC):

- (a) if MC is rising, ATC must be rising.
  - (b) if MC is rising, ATC must be greater than MC.
  - (c) if MC is rising, ATC must be less than MC.
  - (d) if ATC is rising, MC must be greater than ATC.
  - (e) if ATC is rising, MC must be less than ATC.
-

**21.28**

In the reclining chair industry (which is perfectly competitive), two different technologies of production exist. These technologies exhibit the following total cost functions:

$$C_1(Q) = 500 + 260Q - 20Q^2 + Q^3$$

$$C_2(Q) = 1,000 + 145Q - 10Q^2 + Q^3$$

Due to foreign competition, the market price of reclining chairs has fallen to 110. In the short run,

- (a) firms using technology 1 will remain in business and firms using technology 2 will remain in business.
  - (b) firms using technology 1 will remain in business and firms using technology 2 will shut down.
  - (c) firms using technology 1 will shut down and firms using technology 2 will remain in business.
  - (d) firms using technology 1 will shut down and firms using technology 2 will shut down.
  - (e) more information is needed to make a judgment.

**21.1** Not long ago, the Canadian edition of a famous textbook on principles of economics had a diagram depicting a U-shaped average fixed cost curve. This occasioned great mirth around the campfires of some economists in the Great White North and did much to shorten a long hard winter. Explain what is wrong with drawing a U-shaped average fixed cost curve.

*Answer:* Average fixed cost must decline monotonically with output and would asymptotically approach zero. Remember that average fixed cost is just a constant divided by output.

**21.2** Hildegard, an intelligent and charming Holstein cow, grazes in a very large, mostly barren pasture with a few lush patches of grass. When she finds a new grassy area, the amount of grass she gets from it is equal to the square root of the number of hours,  $h$ , that she spends grazing there. Finding a new patch of grass on which to graze takes her one hour. Since Hildegard does not have pockets, the currency in which her costs are measured is time. a) What is the total cost to Hildegard of finding a new plot of grass and getting  $y$  units of grass from it? b) Find an expression for her marginal costs and her average cost per patch of grass as a function of the amount of grass she gets from each patch. c) How much time would she spend in each plot if she wanted to maximize her food intake? (Hint: Minimize average costs per unit of grass eaten.)

*Answer:* a)  $1 + y^2$  b)  $2y, 1/y + y$  c) 1 hour.

Correct Answer: D

Difficulty: 2  
Discrimination Index: 33

**22.1** A profit maximizing firm continues to operate even though it is losing money. It sells its product at a price of \$100. From these facts we deduce that:

- (a) average total cost is less than \$100.
  - (b) average fixed cost is less than \$100.
  - (c) marginal cost is increasing.
  - (d) average variable cost is less than \$100.
  - (e) marginal cost is decreasing.
- 

Topic: Firm Supply  
% Correct Responses: 54  
Correct Answer: C

Difficulty: 1  
Discrimination Index: 27

**22.2** A profit maximizing dairy farm is currently producing 10,000 gallons of milk per day. The government is considering two alternative policies. One is to give the farm a lump sum subsidy of \$500 per month. The other policy is to give the farm a subsidy of \$.05 per gallon of output.

- (a) Both kinds of subsidy will increase production at this farm.
  - (b) Neither subsidy will affect production at this farm, since output is determined by profit maximization.
  - (c) Production at this farm will be increased if the per unit subsidy is adopted, but not if the lump-sum subsidy is adopted.
  - (d) Which subsidy has the greater effect on production at this farm depends on whether fixed costs are greater than variable costs.
  - (e) Production will be increased by either kind of subsidy if and only if there are not decreasing returns to scale.
-

**22.1** The Lost Mountains of northern Iowa are inhabited by the rare Marshallian deer. Patches of grass are far apart in this rugged land. If a deer finds a fresh patch of grass and spends  $h$  hours grazing it, it gets the square root of  $h$  units of grass. The deer compete for grass. When there are  $n$  deer, it takes a deer  $n$  squared minutes to find a fresh patch. A deer can survive if it gets 1 unit of grass every 200 minutes. a) Find the average cost in time of a unit of grass if a deer gets  $y$  units of grass from each patch. b) How much time will an efficient deer spend in each patch when there are  $n$  deer? (Hint: Min. Avg. Cost) c) Since there is free entry into the deer business, the equilibrium population is the maximum number of efficient deer who can survive. How many is this?

*Answer:* a)  $y + (n \text{ squared})/y$  b)  $n$  minutes. c) 100

% Correct Responses: 67  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 21

**23.7** The market for a good is in equilibrium when the government unexpectedly imposes a quantity tax of \$2 per unit. In the short run, the price will rise by \$2 per unit so that firms can regain their lost revenue and continue to produce.

---

---

Topic: Industry Supply  
% Correct Responses: 32  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 18

**23.1** In East Icicle, Minnesota, on the northern edge of the corn belt, the growing season is short and the soil is poor. Corn yields are meager unless a great deal of expensive fertilizer is used. In Corncrib, Illinois the land is fertile and flat and the growing season is 20 days longer. For any given expenditure per acre, corn yields are far greater than in East Icicle. Farmers in both places are profit maximizers who grow corn. We deduce that:

- (a) marginal costs are higher in *E. Icicle* than in Corncrib.
  - (b) more fertilizer is used per acre in *E. Icicle* than in Corncrib.
  - (c) marginal costs are the same in both places.
  - (d) more fertilizer is used per acre in Corncrib than in *E. Icicle*.
  - (e) more than one of the above.
- 

Topic: Industry Supply  
% Correct Responses: 32  
Correct Answer: E

Difficulty: 3  
Discrimination Index: 13

**23.2** A competitive industry has 10,000 identical firms. For each firm in the industry, the long run cost of producing  $y$  units of output is  $c(y) = \$100 + y^2$  if  $y > 0$  and  $c(0) = 0$ . The government imposes a lump sum tax of \$300 on each firm in the industry. Firms can avoid this tax only by going out of business. There is free entry and exit into this industry. In the long run:

- (a) the number of firms stays constant and the price of output rises by \$30.
  - (b) the number of firms doubles and the price of output doubles.
  - (c) the number of firms is halved and the price of output is doubled.
  - (d) the number of firms stays constant and the price of output rises by less than \$30.
  - (e) None of the above.

**23.23** In a certain industry, the supply curve of any firm is  $S_i(p) = p/2$ . If a firm produces 6 units of output, what is its total variable costs?

- (a) \$72
- (b) \$34
- (c) \$54
- (d) \$36
- (e) There is not enough information given to determine total variable costs.

Topic: Industry Supply  
 % Correct Responses: 12  
 Correct Answer: A

Difficulty: 0  
 Discrimination Index: 15

**23.24** An industry has 100 firms. These firms have identical production functions. In the short run, each firm has fixed costs of \$400. There are two variable factors in the short run and output is given by  $y = (\min(x_1, 4x_2))^{1/2}$ . The cost of factor 1 is \$4 per unit and the cost of factor 2 is \$2 per unit. In the short run, the industry supply curve is given by:

- (a)  $Q = 100p/9$
- (b)  $Q = 100p/8$
- (c)  $Q = 600p^{1/2}$
- (d) the part of the line  $Q = 50(\min(4, 8))$  for which  $pQ > 400/Q$ .
- (e) None of the above.

Topic: Industry Supply  
 % Correct Responses: 12  
 Correct Answer: A

Difficulty: 0  
 Discrimination Index: 15

**23.25** An industry has 100 firms. These firms have identical production functions. In the short run, each firm has fixed costs of \$200. There are two variable factors in the short run and output is given by  $y = (\min(x_1, 4x_2))^{1/2}$ . The cost of factor 1 is \$5 per unit and the cost of factor 2 is \$3 per unit. In the short run, the industry supply curve is given by:

- (a)  $Q = 100p/11.50$
- (b)  $Q = 100p/10$
- (c)  $Q = 633.33p^{1/2}$
- (d) the part of the line  $Q = 50(\min(5, 12))$  for which  $pQ > 200/Q$ .
- (e) None of the above.

Discrimination Index: 0

**23.1** The cost per bushel of growing corn on a given acre of land depends partly on how intensely the land is farmed and partly on the quality of the soil, the amount of rainfall and the length of the growing season. Suppose that the last three factors are summarized by a single index "f" for fertility. Suppose that the long run total cost of producing  $y$  hundred bushels of corn on an acre of land of fertility  $f$  is  $c(y, f)$  where  $c(y, f) = (1 + y^2)/f$  for  $y > 0$  and  $c(0, f) = 0$ . a) Write down a formula for the long run average cost function per hundred bushels of corn from an acre of land of quality  $f$ ? b) At what level of output is long run average cost minimized on an acre of land of quality  $f$ ? c) What is the lowest price per hundred bushels at which an acre of land of quality  $f$  will be used to produce corn?

*Answer:* a)  $LRAC = (y + 1/y)/f$  b) 1 hundred bushels c)  $2/f$ .

# Chapter 24

## *True-False*

## Monopoly

---

Topic: Monopoly  
% Correct Responses: 76  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 37

**24.1** Since a monopoly charges a price higher than marginal cost, it will produce an inefficient amount of output.

---

Topic: Monopoly  
% Correct Responses: 45  
Correct Answer: False

Difficulty: 2  
Discrimination Index: 22

**24.2** If the interest rate is 10%, a monopolist will choose a markup of price over marginal cost of at least 10%.

---

Topic: Monopoly  
% Correct Responses: 73  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 13

**24.3** A natural monopoly occurs when a firm gains ownership of the entire stock of some natural resource and thus is able to exclude other producers.

---

Topic: Monopoly  
% Correct Responses: 0  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 0

**24.4** Since a monopoly makes excess profits beyond the normal rate of return on investment, an investor is likely to get a higher rate of return in the stock market by investing in monopolistic rather than competitive industries.

---

Topic: Monopoly  
% Correct Responses: 90  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 3

**24.5** If he produces anything at all, a profit-maximizing monopolist with some fixed costs and no variable costs will set price and output so as to maximize revenue.

---

---

Topic: Monopoly  
% Correct Responses: 85  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 29

**24.6** For a monopolist who faces a downward sloping demand curve, marginal revenue is less than price whenever quantity sold is positive.

---

Topic: Monopoly  
% Correct Responses: 46  
Correct Answer: True

Difficulty: 2  
Discrimination Index: 32

**24.7** A monopolist with constant marginal costs faces a demand curve with a constant elasticity of demand and does not practice price discrimination. If the government imposes a tax of \$1 per unit of goods sold by the monopolist, the monopolist will increase his price by more than \$1 per unit.

---

Topic: Monopoly  
% Correct Responses: 0  
Correct Answer: True

Difficulty: 1  
Discrimination Index: 0

**24.8** A monopolist will always equate marginal revenue and marginal cost when maximizing profit.

---

## Multiple Choice

## Monopoly

% Correct Responses: 91  
Correct Answer: E

Difficulty: 1  
Discrimination Index: 23

**24.4** A monopolist faces the inverse demand curve  $p = 288 - 6q$ . At what level of output is his total revenue maximized?

- (a) 36
  - (b) 34
  - (c) 12
  - (d) 48
  - (e) 24
- 

Topic: Monopoly  
% Correct Responses: 69  
Correct Answer: B

Difficulty: 2  
Discrimination Index: 23

**24.5** The demand for a monopolist's output is 7000 divided by the square of the price in dollars that it charges per unit. The firm has constant marginal costs equal to 1 dollar per unit. To maximize its profits it should charge a price of:

- (a) 1.
  - (b) 2.
  - (c) 3.
  - (d) 1.5.
  - (e) 2.5.
- 

Topic: Monopoly  
% Correct Responses: 68  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 27

**24.6** A profit-maximizing monopolist faces the demand curve,  $q = 100 - 3p$ . It produces at a constant marginal cost of \$20 per unit. A quantity tax of \$10 per unit is imposed on the monopolist's product. The price of the monopolist's product:

- (a) rises by \$5.
  - (b) rises by \$10.
  - (c) rises by \$20.
  - (d) rises by \$12.
  - (e) stays constant.
-

---

Topic: Monopoly  
% Correct Responses: 39  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 44

**24.7** The demand for a monopolist's output is 10,000 divided by the square of the price he charges. The monopolist produces at a constant marginal cost of \$5. If the government imposes a sales tax of \$10 per unit on the monopolist's output, the monopolist's price will rise by:

- (a) \$5.
  - (b) \$10.
  - (c) \$20.
  - (d) \$12.
  - (e) None of the above.
- 

Topic: Monopoly  
% Correct Responses: 56  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 35

**24.8** The demand for a monopolist's output is  $2,000/(p+1)^2$  where  $p$  is the price she charges. At a price of 3, the elasticity of demand for the monopolist's output is:

- (a) -1.
  - (b) -2.50.
  - (c) -1.50.
  - (d) -2.
  - (e) -1.
- 

Topic: Monopoly  
% Correct Responses: 56  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 35

**24.9** The demand for a monopolist's output is  $4,000/(p+5)^2$  where  $p$  is the price she charges. At a price of 9, the elasticity of demand for the monopolist's output is:

- (a) -1.
  - (b) -2.29.
  - (c) -1.29.
  - (d) -1.79.
  - (e) -0.79.
-

% Correct Responses: 95  
Correct Answer: E

Difficulty: 1  
Discrimination Index: 0

**24.13** A profit-maximizing monopolist sets:

- (a) price equal to average cost.
  - (b) price equal to marginal cost.
  - (c) price equal to marginal cost plus a pro-rated share of overhead.
  - (d) price equal to marginal revenue.
  - (e) marginal revenue equal to marginal cost.
- 

Topic: Monopoly  
% Correct Responses: 38  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 32

**24.14** A monopolist has decreasing average costs as output increases. If the monopolist sets price equal to average cost, it will:

- (a) produce too much output from the standpoint of efficiency.
  - (b) lose money.
  - (c) produce too little output from the standpoint of efficiency.
  - (d) maximize its profits.
  - (e) face excess demand.
- 

Topic: Monopoly  
% Correct Responses: 87  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 24

**24.15** A profit maximizing monopolist faces a downward sloping demand curve that has a constant elasticity of  $-4$ . The firm finds it optimal to charge a price of 60 for its output. What is its marginal cost at this level of output?

- (a) 23.50
  - (b) 136
  - (c) 120
  - (d) 45
  - (e) 60
-

---

Topic: Monopoly  
% Correct Responses: 87  
Correct Answer: D

Difficulty: 1  
Discrimination Index: 24

**24.16** A profit maximizing monopolist faces a downward sloping demand curve that has a constant elasticity of  $-2$ . The firm finds it optimal to charge a price of 60 for its output. What is its marginal cost at this level of output?

- (a) 16
- (b) 91
- (c) 120
- (d) 30
- (e) 60

---

Topic: Monopoly

Correct Answer: D

Difficulty: 2  
Discrimination Index: 3

**24.17** A monopolist has constant marginal costs of \$1 per unit. The demand for her output is  $1000/p$  if  $p$  is less than or equal to 50. The demand is 0 if  $p > 50$ . What is her profit maximizing level of output?

- (a) 5
- (b) 10
- (c) 15
- (d) 20
- (e) 25

---

Topic: Monopoly  
% Correct Responses: 42  
Correct Answer: B

Difficulty: 2  
Discrimination Index: 32

**24.18** The demand curve for the output of a certain industry is linear,  $q = A - Bp$ . There are constant marginal costs of  $C$ . For all values of  $A$ ,  $B$ , and  $C$  such that  $A > 0$ ,  $B > 0$ , and  $0 < C < A/B$ :

- (a) if the industry is monopolized, prices will be exactly twice as high as they would be if the industry were competitive.
  - (b) if the industry is competitive, output will be exactly twice as great as it would be if the industry were monopolized.
  - (c) if the industry is monopolized, prices will be more than twice as high as if the industry is competitive.
  - (d) if the industry is monopolized, output will be more than half as large as it would be if the industry were competitive.
  - (e) None of the above.
-

---

Topic: Monopoly  
% Correct Responses: 15  
Correct Answer: B

Difficulty: 3  
Discrimination Index: 0

**24.19** A monopolist receives a subsidy from the government for every unit of output that is consumed. He has constant marginal costs and the subsidy that he gets per unit of output is greater than his marginal cost of production. But to get the subsidy on a unit of output, somebody has to consume it. From these facts we can conclude that:

- (a) he will pay consumers to consume his product.
  - (b) if he sells at a positive price, demand must be inelastic at that price.
  - (c) he will sell at a price where demand is elastic.
  - (d) he will give the good away.
  - (e) None of the above.
- 

Topic: Monopoly  
% Correct Responses: 59  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 24

**24.20** A monopolist faces the demand curve  $q = 110 - p/2$  where  $q$  is the number of units sold and  $p$  is the price in dollars. He has quasi-fixed costs,  $C$ , and constant marginal costs of \$20 per unit of output. Therefore his total costs are  $C + 20q$  if  $q > 0$  and 0 if  $q = 0$ . What is the largest value of  $C$  for which he would be willing to produce positive output?

- (a) \$20
  - (b) \$4,000
  - (c) \$5,000
  - (d) \$7,500
  - (e) \$6,000
-

---

Topic: Monopoly  
% Correct Responses: 59  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 24

**24.21** A monopolist faces the demand curve  $q = 115 - p/2$  where  $q$  is the number of units sold and  $p$  is the price in dollars. He has quasi-fixed costs,  $C$ , and constant marginal costs of \$30 per unit of output. Therefore his total costs are  $C + 30q$  if  $q > 0$  and 0 if  $q = 0$ . What is the largest value of  $C$  for which he would be willing to produce positive output?

- (a) \$30
  - (b) \$4,000
  - (c) \$5,000
  - (d) \$7,500
  - (e) \$6,000
- 

Topic: Monopoly  
% Correct Responses: 0  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 0

**24.22** A natural monopolist has the a total cost function  $c(q) = 350 + 20q$  where  $q$  is its output. The inverse demand function for the monopolist's product is  $p = 100 - 2q$ . Government regulations require this firm to produce a positive amount and to set price equal to average cost. To comply with these requirements:

- (a) is impossible for this firm.
  - (b) the firm must produce 40 units.
  - (c) the firm could produce either 5 units or 35 units.
  - (d) the firm must charge a price of 70.
  - (e) the firm must produce 20 units.
-

**24.24** A monopolist has the total cost function,  $c(q) = 850 + 4q$ . The inverse demand function is  $190 - 5q$ , where prices and costs are measured in dollars. If the firm is required by law to meet demand at a price equal to its marginal cost:

- (a) the firm's profits will be zero.
  - (b) the firm will lose \$425.
  - (c) the firm will make positive profit, but not as much profit as it would make if it were allowed to choose its own price.
  - (d) the firm will lose \$850
  - (e) the firm will lose \$510
-

---

Topic: Monopoly  
% Correct Responses: 61  
Correct Answer: B

Difficulty: 2  
Discrimination Index: 10

**24.25** A monopolist enjoys a monopoly over the right to sell automobiles on a certain island. He imports automobiles from abroad at a cost of \$10,000 each and sells them at the price that maximizes profits. One day, the island's government annexes a neighboring island and extends the monopolist's monopoly rights to this island. People on the annexed island have the same tastes and incomes and there are just as many people as on the first.

- (a) The monopolist doubles his price and his sales stay constant.
  - (b) The monopolist keeps his price constant and his sales double.
  - (c) The monopolist raises his price but does not necessarily double it.
  - (d) The monopolist's profits more than double.
  - (e) None of the above.
- 

Topic: Monopoly

**24.27** A monopoly has the demand curve  $q = 10,000 - 100p$ . Its total cost function is  $c(q) = 1000 + 10q$ . The government plans to tax the monopoly's profits at a rate of 50%. If it does so:

- (a) the monopoly will increase its price by 50%.
  - (b) the monopoly will increase its price by more than 50%.
  - (c) the monopoly will recover some, but not all of the tax it pays by increasing its price.
  - (d) the monopoly will not change its price or the quantity it sells.
  - (e) none of the above.
- 

Topic: Monopoly  
% Correct Responses: 0  
Correct Answer: E

Difficulty: 2  
Discrimination Index: 0

**24.28** A monopolist faces a downward-sloping demand curve and has fixed costs so large that when he maximizes profits with a positive amount of output, he earns exactly zero profits. At this positive, profit-maximizing output, it must be that:

- (a) there are decreasing returns to scale.
  - (b) demand is price inelastic.
  - (c) marginal revenue is greater than marginal cost.
  - (d) price equals marginal cost.
  - (e) average total cost is greater than marginal cost.
-

---

Topic: Monopoly  
% Correct Responses: 70  
Correct Answer: D

Difficulty: 2  
Discrimination Index: 45

**24.29** A computer software firm has developed a new and better spreadsheet program. The program is protected by copyrights, so the firm can act as a monopolist for this product. The demand function for the spreadsheet is  $q = 50,000 - 100p$ . Any single consumer will want only one copy. The marginal cost of producing and distributing another copy and its documentation is just \$10 per copy. If the company sells this software at the profit maximizing monopoly price, the number of consumers who would not buy the software at the monopoly price but would be willing to pay at least the marginal cost is:

- (a) 50,000.
  - (b) 12,000.
  - (c) 14,000.
  - (d) 25,000.
  - (e) None of the above.

**24.30** The town council of Frostbite, Ontario is trying to decide whether to build an outdoor skating rink which would cost \$1 million and last for only one season. Operating costs would be zero. Yearly passes would be sold to anyone who wanted to use the rink. If  $p$  is the price of the pass in dollars, the number demanded would be  $q = 1200 - .6p$ . The council has asked you to advise them on building the rink. You should tell them:

- (a) revenues won't cover construction costs at any ticket price. There is no way to increase total consumer surplus by building the rink.
  - (b) if the rink is built and price is set to maximize profits, the town makes a profit and consumers will be better off.
  - (c) if the rink is built and price set to maximize profits, the town makes a profit but consumers are worse off than without a rink.
  - (d) there is no price at which ticket revenues still cover costs, but total consumer surplus from the rink exceeds costs.
  - (e) None of the above.

**24.31** A monopolist produces at a point where the price elasticity of demand is  $-0.7$  and the marginal cost is 2. If you were hired to advise this monopolist on how to increase his profits, you would find that the way to increase his profits is to:

- (a) increase his output.
  - (b) lower the price.
  - (c) decrease his output.
  - (d) produce the output level where marginal cost equals price.
  - (e) increase his advertising efforts.
-

**24.32** The Hard Times Concrete company is a monopolist in the concrete market. It uses two inputs, cement and gravel, which it buys in competitive markets. The company's production function is  $q = c^{1/2}g^{1/2}$  where  $q$  is its output,  $c$  is the amount of cement it uses, and  $g$  is the amount of gravel it uses. If the price of cement goes up the firm's demand for cement:

- (a) goes down and its demand for gravel goes up.
  - (b) goes down and its demand for gravel goes down.
  - (c) goes down and its demand for gravel may go up, down, or remain the same, depending on the demand function for concrete.
  - (d) may go up, down, or not change, based on whether the cement's elasticity of demand is less than, equal to, or greater than  $-1$ .
  - (e) could go up or down, but must move in the opposite direction from its demand for gravel.

**24.34** Charlie can work as many hours as he wishes at a local fast food restaurant for a wage of \$4 per hour. Charlie also does standup comedy. Since Charlie lives in a quiet, rather solemn midwestern town, he is the town's only comedian and has a local monopoly for standup comedy. The demand for comedy is  $Q = 40 - P$  where  $Q$  is the number of hours of comedy performed per week and  $P$  is the price charged per hour of comedy. When Charlie maximizes his utility, he spends at least one hour per week working at the restaurant and he gets at least one hour of leisure time. His utility depends only on income and leisure. How many hours per week does he perform standup comedy?

- (a) 36
  - (b) 40
  - (c) 18
  - (d) 20
  - (e) We can't tell without knowing his utility function.

Discrimination Index: 0

**24.1** A baseball team's attendance depends on the number of games it wins per season and on the price of its tickets. The demand function it faces is  $Q = N(20 - p)$  where  $Q$  is the number of tickets (in hundred thousands) sold per year,  $p$  is the price per ticket and  $N$  is the fraction of its games that the team wins. The team can increase the number of games it wins by hiring better players. If the team spends  $C$  million dollars on players it will win the fraction  $.7 - 1/C$  of its games. Over the relevant range, marginal cost of selling an extra ticket is zero. a) Write an expression for the firm's profits as a function of ticket price and expenditure on players. b) Find the ticket price that maximizes revenue. c) Find the profit maximizing expenditure on players and the profit maximizing fraction of games to win.

*Answer:* a)  $(.7 - 1/C)(20 - p)p - C$  b)  $p = 10$  c)  $C = 10$

Topic: Monopoly Behavior

Difficulty: 1

% Correct Responses: 80

Discrimination Index: 15

Correct Answer: True

**25.6** In order to maximize his profits, a monopolist who practices third degree price discrimination with two or more markets should charge higher prices in markets with more inelastic demand functions.

Topic: Monopoly Behavior

Difficulty: 1

% Correct Responses: 71

Discrimination Index: 20

Correct Answer: False

**25.7** A profit-maximizing monopolist is able to practice third degree price discrimination. If he charges  $p_1$  in market 1 and  $p_2$  in market 2, where  $p_1 > p_2$ , it must be that the quantity sold in market 1 is smaller than the quantity sold in market 2.

Topic: Monopoly Behavior

Difficulty: 2

% Correct Responses: 32

Discrimination Index: 24

Correct Answer: False

**25.8** A profit-maximizing monopolist practices third degree price discrimination. If he charges  $p_1$  in market 1 and  $p_2$  in market 2, where  $p_1 > p_2$ , then if the law forced him to charge the same price in both markets, more would be demanded in market 1 than in market 2.

Topic: Monopoly Behavior

Difficulty: 2

% Correct Responses: 74

Discrimination Index: 27

Correct Answer: True

**25.9** A price discriminating monopolist charges  $p_1$  in market 1 and  $p_2$  in market 2. If  $p_1 > p_2$ , it must be that the absolute value of the price elasticity in market 1 at price  $p_1$  is smaller than the absolute value of the price elasticity in market 2 at price  $p_2$ .

Topic: Monopoly Behavior

Difficulty: 1

% Correct Responses: 0

Discrimination Index: 0

Correct Answer: False

**25.10** A monopolist who is able to practice third degree price discrimination charges a higher price in the market that is more elastic.

---

Topic: Monopoly Behavior

Difficulty: 2

% Correct Responses: 31

Discrimination Index: 23

Correct Answer: C

**25.1** A monopolist is able to practice third degree price discrimination between two markets. The demand function in the first market is  $q = 500 - 2p$  and the demand function in the second market is  $q = 1500 - 6p$ . To maximize his profits, he should:

- (a) charge a higher price in the second market than in the first.
  - (b) charge a higher price in the first market than in the second.
  - (c) charge the same price in both markets.
  - (d) sell only in one of the two markets.
  - (e) none of the above.
- 

Topic: Monopoly Behavior

Difficulty: 2

% Correct Responses: 45

Discrimination Index: 0

Correct Answer: B

**25.2** A monopolist finds that a person's demand for its product depends on the person's age. The inverse demand function of someone of age  $y$ , can be written  $p = A(y) - q$  where  $A(y)$  is an increasing function of  $y$ . The product cannot be resold from one buyer to another and the monopolist knows the ages of its consumers. If the monopolist maximizes its profits:

- (a) older people will pay higher prices and purchase less of this product.
  - (b) older people will pay higher prices and purchase more of this product.
  - (c) older people will pay lower prices and purchase more of this product.
  - (d) everyone pays the same price but old people consume more.
  - (e) None of the above.
-

---

Topic: Monopoly Behavior  
% Correct Responses: 17  
Correct Answer: A

Difficulty: 3  
Discrimination Index: 24

**25.3** A monopolist has discovered that the inverse demand function of a person with income  $M$  for the monopolist's product is  $p = .002M - q$ . The monopolist is able to observe the incomes of its consumers and to practice price discrimination according to income (second-degree price discrimination). The monopolist has a total cost function,  $c(q) = 100q$ . The price it will charge a consumer depends on the consumer's income,  $M$ , according to the formula:

- (a)  $p = .001M + 50$ .
  - (b)  $p = .002M - 100$ .
  - (c)  $p = M^2$ .
  - (d)  $p = .01M^2 + 100$ .
  - (e) None of the above.
-

**26.4** The frangle industry is a monopoly, with a demand curve  $100 - p$ , where  $p$  is the price of frangles. It takes one unit of labor and no other inputs to produce a frangle. The Frangle-makers Guild is a strong union. The Guild sets a wage and prevents anyone from working for less than that wage. The frangle monopoly must pay that wage but can hire as much labor as it chooses to. If the guild chooses a wage so as to maximize the total earnings (wage times number of units of labor hired) of frangle-makers, then:

- (a) the price of frangles will be 50.
  - (b) the price of frangles will be 25.
  - (c) the price of frangles will equal the wage rate.
  - (d) the wage rate will be 25.
  - (e) the wage will be 50.

**26.5** The bauble industry is competitive with free entry. There is a fixed-coefficient technology. One unit of labor and one unit of plastic are required for each bauble. Workers in the bauble industry must all belong to the Bauble-makers Union. The union sets the wage that will be paid to all bauble-makers. The price of plastic is 10 dollars per unit and the demand function for baubles is  $1000 - 10p$ . Long run equilibrium requires that the price of baubles equals the cost of production. The wage per unit of labor that maximizes total revenue of workers is:

- (a) 100.
  - (b) 10.
  - (c) 45.
  - (d) 20.
  - (e) infinity.
-

**26.1** This comes from an actual newspaper story. "The average price of a home in *W.* county rose more than 12% last year...but the number of sales fell nearly 15%. 'It's the old law of supply and demand', said a spokesman for the Board of Realtors. 'The number of sales is down because there's a higher demand for properties but there isn't a corresponding number to sell.'" a) What does the "old law of supply and demand" predict would happen to price and quantity if the demand curve shifts outward and the supply curve does not change? b) Draw a diagram to illustrate the case of a shift in demand and or supply curves that is consistent with the observed change in prices and quantities.

*Answer:* a) The price would rise and the quantity would rise. Even if the supply were very inelastic, the number of sales would not fall if the supply curve did not shift. b) One simple case would be a leftward shift in the supply curve and no change in the demand curve.

**27.7** A city has two major league baseball teams, A and B. The number of tickets sold by either team depends on the price of the team's own tickets and the price of the other team's ticket. If team A charges  $P_a$  for its tickets and team B charges  $P_b$  for its tickets, then ticket sales, measured in hundreds of thousands per season are  $20 - 2P_a + P_b$  for team A and  $10 + P_a - 2P_b$  for team B. The marginal cost of an extra spectator is zero for both teams. Each team believes the other's price is independent of its own choice of price and each team sets its own price so as to maximize its revenue. What price do they charge per ticket?

- (a) Team A charges 6 and team B charges 4.
  - (b) Team A charges 8 and team B charges 3.
  - (c) Team A charges 7 and team B charges 6.
  - (d) Team A charges 6 and team B charges 8.
  - (e) None of the above.
- 

Topic: Oligopoly  
% Correct Responses: 66  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 44

**27.8** A city has two major league baseball teams, A and B. The number of tickets sold by either team depends on the price of the team's own tickets and the price of the other team's ticket. If team A charges  $P_a$  for its tickets and team B charges  $P_b$  for its tickets, then ticket sales, measured in hundreds of thousands per season are  $21 - 2P_a + P_b$  for team A and  $6 + P_a - 2P_b$  for team B. The marginal cost of an extra spectator is zero for both teams. Each team believes the other's price is independent of its own choice of price and each team sets its own price so as to maximize its revenue. What price do they charge per ticket?

- (a) Team A charges 6 and team B charges 3.
  - (b) Team A charges 8 and team B charges 2.
  - (c) Team A charges 7 and team B charges 5.
  - (d) Team A charges 6 and team B charges 6.
  - (e) None of the above.
-

**27.23** Consider a market with one large firm and many small firms. The supply function of all of the small firms together is given by  $S(p) = 200 + p$ , the market demand curve is given by  $D(p) = 400 - p$ , and the cost function for the large firm is  $C(y) = 20y$ . The residual demand curve for the large firm (where  $D_L$  is large firm's demand and  $y_L$  is large firm's output) is given by:

- (a)  $D_L(p) = 400 - 21y_L$ .
  - (b)  $D_L(p) = 200 - 2p$ .
  - (c)  $D_L(p) = 600 - 2p$ .
  - (d)  $D_L(y_L) = 200 - 2p - 20y_L$ .
  - (e)  $D_L(y_L) = 200 + p + 20y_L$ .

Correct Answer: False

Difficulty: 1  
Discrimination Index: 41

**28.4** A general has the two possible pure strategies, sending all of his troops by land or all of his troops by sea. An example of a mixed strategy is where he sends 1/4 of his troops by land and 3/4 of his troops by sea.

---

Topic: Game Theory  
% Correct Responses: 0  
Correct Answer: False

Difficulty: 1  
Discrimination Index: 0

**28.5** While game theory predicts noncooperative behavior for a single play of prisoners' dilemma, it would predict cooperative tit-for-tat behavior if the same people play prisoners' dilemma together for, say, 20 rounds.

---

---

Topic: Game Theory	Difficulty: 1
% Correct Responses: 80	Discrimination Index: 33
Correct Answer: False	

**28.6** A two-person game in which each person has access to only two possible strategies will have at most one Nash equilibrium.

---

Topic: Game Theory	Difficulty: 1
% Correct Responses: 93	Discrimination Index: 13
Correct Answer: True	

**28.7** A dominant strategy equilibrium is a set of choices such that each player's choices are optimal regardless of what the other players choose.

---

Topic: Game Theory	Difficulty: 1
% Correct Responses: 0	Discrimination Index: 0
Correct Answer: True	

**28.8** In Nash equilibrium, each player is making an optimal choice for herself, given the choices of the other players.

---

Topic: Game Theory	Difficulty: 1
% Correct Responses: 79	Discrimination Index: 2
Correct Answer: False	

**28.9** If a game does not have an equilibrium in pure strategies, then it will not have an equilibrium in mixed strategies either.

---

Topic: Game Theory	Difficulty: 2
% Correct Responses: 82	Discrimination Index: 15
Correct Answer: False	

**28.10** A game has two players and each has two strategies. The strategies are Be Nice and Be Mean. If both players play Be Nice, both get a payoff of 5. If both players play Be Mean, both get a payoff of  $-3$ . If one player plays Be Nice and the other plays Be Mean, the player who played Be Nice gets 0 and the player who played Be Mean gets 10. Playing Be Mean is a dominant strategy for both players.

---

---

Topic: Game Theory  
% Correct Responses: 74  
Correct Answer: C

Difficulty: 2  
Discrimination Index: 57

**28.1** A game has two players. Each player has two possible strategies. One strategy is called “cooperate”, the other is called “defect”. Each player writes on a piece of paper either a  $C$  for cooperate or a  $D$  for defect. If both players write  $C$ , they both get a payoff of \$100. If both players defect they each get a payoff of 0. If one player cooperates and the other player defects, the cooperating player gets a payoff of  $S$  and the defecting player gets a payoff of  $T$ . To defect will be a dominant strategy for both players if:

- (a)  $S + T > 100$
  - (b)  $T > 2S$
  - (c)  $S < 0$  and  $T > 100$ .
  - (d)  $S < T$  and  $T > 100$ .
  - (e)  $S$  and  $T$  are any positive numbers.
- 

Topic: Game Theory  
% Correct Responses: 89  
Correct Answer: C

Difficulty: 1  
Discrimination Index: 33

**28.2** In the game matrix below, the first payoff in each pair goes to Player A who chooses the row, and the second payoff goes to Player B, who chooses the column. Let  $a$ ,  $b$ ,  $c$ , and  $d$  be positive constants. If Player A chooses bottom and Player B chooses right in a Nash equilibrium then we know that: !ta game1.tab!

- (a)  $b > 1$  and  $d < 1$ .
  - (b)  $c < 1$  and  $b < 1$ .
  - (c)  $b < 1$  and  $c < d$ .
  - (d)  $b < c$  and  $d < 1$ .
  - (e)  $a < 1$  and  $b < d$ .
-

---

Topic: Game Theory  
% Correct Responses: 36  
Correct Answer: A

Difficulty: 2  
Discrimination Index: 35

**28.3** In the town of Torrelozones, each of the  $N > 2$  inhabitants has \$100. They are told that they can all voluntarily contribute to a fund that will be evenly divided among all residents. If \$ $F$  are contributed to the fund, the local K-Mart will match the private contributions so that the total amount to be divided is \$ $2F$ . That is, each resident will get back a payment of \$ $2F/N$  when the fund is divided. If people in town care only about their own net incomes, in Nash equilibrium, how much will each person contribute to the fund?

- (a) 0
  - (b) \$10
  - (c) \$20
  - (d) \$50
  - (e) \$100
- 

Topic: Game Theory  
% Correct Responses: 43  
Correct Answer: C

**28.4** Frank and Nancy met at a sorority sock-hop. They agreed to meet for a date at a local bar the next week. Regrettably, they were so fraught with passion that they forgot to agree on which bar would be the site of their rendezvous. Luckily, the town has only two bars, Rizotti's and the Oasis. Having discussed their tastes in bars at the sock-hop, both are aware that Frank prefers Rizotti's to the Oasis and Nancy prefer the Oasis to Rizottis. In fact, the payoffs are as follows. If both go to the Oasis, Nancy's utility is 3 and Frank's utility is 2. If both go to Rizotti's, Frank's utility is 3 and Nancy's utility is 2. If they don't both go to the same bar, both have a utility of 0.

- (a) This game has no Nash equilibrium in pure strategies.
  - (b) This game has a dominant strategy equilibrium.
  - (c) There are two Nash equilibria in pure strategies and a Nash equilibrium in mixed strategies where the probability that Frank and Nancy go to the same bar is  $12/25$ .
  - (d) This game has two Nash equilibria in pure strategies and a Nash equilibrium in mixed strategies where each person has a probability of  $1/2$  of going to each bar.
  - (e) This game has exactly one Nash equilibrium.

**28.5** George and Sam have taken their fathers' cars out on a lonely road and are engaged in a game of "Chicken". George has his father's Mercedes and Sam has his father's rattly little Yugoslavian-built subcompact car. Each of the players can choose either to Swerve or to Not Swerve. If both choose Swerve, both get a payoff of zero. If one chooses Swerve and the other chooses Not Swerve, the one who chooses Not Swerve gets a payoff of 10 and the one who chooses Swerve gets zero. If both choose Not Swerve, the damage to George's car is fairly minor and he gets a payoff of  $-5$ , while for Sam the results are disastrous and he gets a payoff of  $-100$ .

- (a) This game has a dominant strategy equilibrium in which George does not swerve and Sam swerves.
  - (b) This game has two pure strategy Nash equilibria and no mixed-strategy equilibrium.
  - (c) This game has three different Nash equilibria, two of which are pure strategy equilibria and one of which is a mixed strategy equilibrium in which George is more likely to swerve than Sam is.
  - (d) The one and only Nash equilibrium in this game is where George does not swerve and Sam swerves.
  - (e) This game has two pure strategy equilibria and a mixed strategy equilibrium in which Sam randomizes his strategy and George chooses Not Swerve with certainty.

**28.8** Two players are engaged in a game of "Chicken". There are two possible strategies. Swerve and Drive Straight. A player who chooses to Swerve is called "Chicken" and gets a payoff of zero, regardless of what the other player does. A player who chooses to Drive Straight gets a payoff of 12 if the other player swerves and a payoff of  $-12$  if the other player also chooses to Drive Straight. This game has two pure strategy equilibria and:

- (a) a mixed strategy equilibrium in which each player swerves with probability 0.50 and drives straight with probability 0.50.
  - (b) two mixed strategies in which players alternate between swerving and driving straight.
  - (c) a mixed strategy equilibrium in which one player swerves with probability 0.50 and the other swerves with probability 0.50.
  - (d) a mixed strategy in which each player swerves with probability 0.25 and drives straight with probability 0.75.
  - (e) no mixed strategies.
-

**28.10** A famous Big Ten football coach had only two strategies. Run the ball to the left side of the line. Run the ball to the right side. The defense can concentrate forces on the left side or the right side. If the opponent concentrates on the wrong side, his offense is sure to gain at least 5 yards. If the defense defended the left side and the offense ran left, it gain only 1 yard. If the opponent defended the right side when the offense ran right, the offense would still gain at least 5 yards with probability 0.70. It is the last play of the game and the famous coach's team is on offense. If it makes 5 yards or more it wins, if not it loses. Both sides choose Nash equilibrium strategies. In equilibrium the offense:

- (a) is sure to run to the right side.
  - (b) will run to the right side with probability 0.77.
  - (c) will run to the right side with probability 0.87.
  - (d) will run to the two sides with equal probability.
  - (e) will run to the right side with probability 0.70.

**28.1** The coach of the offensive football team has two options on the next play. He can run the ball or he can pass. His rival can defend either against the run or against the pass. Suppose that the offense passes. Then if the defense defends against the pass, it will make zero yards and if the defense defends against the run, it will make 25 yards. Suppose that the offense runs. If the defense defends against the pass, the offense will make 10 yards and if the defense defends against a run, the offense will gain 2 yards. a) Write down a payoff matrix for this game. b) Is there a Nash equilibrium in pure strategies for this game? If so, what is it? If not, demonstrate that there is none.

*Answer:* This game does not have a Nash equilibrium in pure strategies. The best response to a pass (run) is a defense against the pass (run). But the best response to a defense against the pass (run) is to run (pass).

**29.11** Dan and Marilyn consume two goods,  $x$  and  $y$ . They have identical Cobb-Douglas utility functions. Initially Dan owns 10 units of  $x$  and 10 units of  $y$ . Initially Marilyn owns 40 units of  $x$  and 20 units of  $y$ . They make exchanges to reach a Pareto optimal allocation which is better for both than the no-trade allocation. Which of the following is NOT necessarily true about the allocation they trade to?

- (a) Marilyn consumes 5 units of  $x$  for every 3 units of  $y$  that she consumes.
  - (b) The locus of Pareto optimal allocations is a diagonal straight line in the Edgeworth box.
  - (c) Dan's consumption of  $x$  is greater than his consumption of  $y$ .
  - (d) Dan consumes more than 10 units of  $x$ .
  - (e) Marilyn consumes at least 40 units of  $x$ .

**30.6** Last year a pestilential fungus ravaged the cocoa fields. The price of chocolate has risen abruptly to \$1 per ounce. The government is considering emergency measures to aid suffering chocolate addicts. One plan being considered is the Chocolate Relief Plan (CRP). This plan would set a price ceiling of \$.80 per ounce on chocolate. This would cause a shortage, so the CRP will limit consumption to no more than 10 ounces of chocolate per person per week. At \$.80 per ounce, enough chocolate would be produced for everyone to have 10 ounces. Jill buys less than 10 ounces per week at \$1 per ounce, but would buy more than 10 ounces if the price dropped to \$.80.

- (a) Jill is definitely better off without the CRP.
  - (b) Jill is better off without the CRP if \$1 is the competitive equilibrium price without the CRP.
  - (c) Jill is better off with CRP only if the industry is monopolized and the price exceeds marginal cost in the absence of the CRP.
  - (d) Jill is definitely better off with the CRP.
  - (e) None of the above.

**31.1** No one is meaner and uglier than Gladys. Someone is meaner and uglier than Harold. Therefore Gladys is meaner and uglier than Harold. Is this reasoning correct? If so, explain why. If not, explain why not. (Assume that people can be ranked from ugliest to least ugly by a complete transitive ordering and that there are no ties. Likewise assume that people can be ranked from meanest to least mean by a complete transitive ordering and that there are no ties.)

*Answer:* The reasoning is incorrect. Consider the following example. There are 3 people: Fred, Gladys and Harold. The rankings for ugly are Gladys is ugliest, Fred is second ugliest and Harold is least ugly. The rankings for mean are Fred is meanest, Harold is second meanest and Gladys is least mean. Then nobody is meaner and uglier than Gladys. Fred is meaner and uglier than Harold, but Gladys is not meaner and uglier than Harold.

**32.16** An apiary is located next to an apple orchard. The apiary produces honey and the apple orchard produces apples. The cost function of the apiary is  $C_H(H, A) = H^2/100 - 3A$  and the cost function of the apple orchard is  $C_A(H, A) = A^2/100$  where  $H$  and  $A$  are the number of units of honey and apples produced respectively. The price of honey is 3 and the price of apples is 4 per unit. Let  $A_1$  be the output of apples if the firms operate independently, and let  $A_2$  be the output of apples if the firms are operated by a single owner so as to maximize total profit.

- (a)  $A_1 = 100$  and  $A_2 = 200$
  - (b)  $A_1 = A_2 = 200$
  - (c)  $A_1 = 175$  and  $A_2 = 200$
  - (d)  $A_1 = 200$  and  $A_2 = 350$
  - (e)  $A_1 = 150$  and  $A_2 = 200$

**32.23** Millie Bush has written a best-seller. Revenues net of production costs are  $\$300T^{1/3}A^{1/3}$  where  $T$  is the number of publicity trips Millie takes and  $A$  is the number of ads for the book that appear. Millie has to pay for all of her own publicity trips, which cost \$100 each. Her publisher pays for the advertising, which costs \$100 per ad. Revenues from the book are split equally between Millie and her publisher. Let  $T_1$  be the number of trips that Millie would choose to make in a Nash equilibrium where she chooses the number of trips and the publisher chooses the amount of advertising. Let  $T_2$  be the number of trips that Millie should make if trips and advertising are determined so as to maximize total profits net of trip and ad costs.

- (a)  $T_1 = 1$  and  $T_2 = 1$ .
  - (b)  $T_1 = 1$  and  $T_2 = 2$ .
  - (c)  $T_1 = 2$  and  $T_2 = 1$ .
  - (d)  $T_1 = 1$  and  $T_2 = 1/8$ .
  - (e)  $T_1 = 1/8$  and  $T_2 = 1$ .

**32.1** Two firms in a grimy Ohio town produce the same product in a competitive industry. Each has an old factory using an old technology. It still pays to operate these factories but it would not pay to expand them. The only variable factor used by either firm is labor. Each firm pollutes the other and thus reduces the output of the other firm. The production functions of firms A and B respectively are  $Q_a = L_a^5 - (2/3)Q_b$  and  $Q_b = L_b^5 - (1/3)Q_a$  where  $L_a^5$  and  $L_b^5$  are the square roots respectively of the amount of labor used by firms A and B. The wage rate of labor is 1 and the price of the firms' output is 12. a) If the two firms each maximize profits independently, what is their total output and how much quasi-rents do their factories earn? b) If someone buys them both and maximizes joint profits, how much quasi-rents are earned in total?

*Answer:* Each produces 48 and quasirents are 12 for each. Each produces 36 and quasirents total 40.

The number of students taking the course in the first year who are willing to pay at least  $\$w$  to keep the book for reference rather than resell it is  $50,000 - 5,000w$ . In the second year, the number of students who have not previously taken the course and are willing to pay at least  $\$p$  for a copy of the book is  $40,000 - 1,000p$ . If the publisher sets a price of  $p_1$  in the first year and  $p_2$  in the second year, with  $p_1 \geq p_2$ , then the total number of copies that the publisher sells over two years will be equal to

(a)  $90,000 - 1,000(p_1 + p_2/2)$ .

(b)  $100,000 - 1,000(p_1 - (p_2/2))$ .

(c)  $100,000 - 3,000p_2$ .

(d)  $100,000 - 1,000p_1 - 1,000p_2$ .

(e)  $90,000 - 1,500p_2$ .

**34.10** Professor Kremepuff has published a new textbook. This book will be used in classes for two years, at which time it will be replaced by a new edition. The publisher charges a price of  $\$p_1$  in the first year and  $\$p_2$  in the second year. After the first year, bookstores buy back copies from students for  $\$p_2/2$  and resell them to students in the second year for  $\$p_2$ . (Students are indifferent between new and used copies.) The cost to a student in the first year of owning the book for a year is therefore  $\$p_1 - (p_2/2)$ . In the first year of publication, the number of students willing to pay  $\$v$  to own the book for a year is  $50,000 - 1,000v$ . The number of students taking the course in the first year who are willing to pay at least  $\$w$  to keep the book for reference rather than resell it is  $50,000 - 5,000w$ . In the second year, the number of students who have not previously taken the course and are willing to pay at least  $\$p$  for a copy of the book is  $40,000 - 1,000p$ . If the publisher sets a price of  $p_1$  in the first year and  $p_2$  in the second year, with  $p_1 \geq p_2$ , then the total number of copies that the publisher sells over two years will be equal to

- (a)  $90,000 - 1,000(p_1 + p_2/2)$ .
  - (b)  $100,000 - 1,000(p_1 - (p_2/2))$ .
  - (c)  $100,000 - 3,000p_2$ .
  - (d)  $100,000 - 1,000p_1 - 1,000p_2$ .
  - (e)  $90,000 - 1,500p_2$ .

**36.1** A firm hires two kinds of workers, alphas and betas. The population at large has equal number of alphas and betas. One can't tell a beta from an alpha by looking at her, but an alpha will produce \$3,000 worth of output per month and a beta will produce \$2,500 worth of output in a month. The firm decides to distinguish alphas from betas by making them pass an examination. For each question that they get right on the exam, alphas have to spend 1/2 hour studying and betas have to spend 1 hour. A worker will be paid \$3,000 if she gets at least 60 answers right and \$2,500 otherwise. For either type, an hour's studying is as bad as giving up \$20 income per month. This scheme leads to:

- (a) a separating equilibrium where alphas score 60 and betas score 0.
- (b) a pooling equilibrium where alphas score 60 and betas score 0.
- (c) a pooling equilibrium where everybody scores 60.
- (d) a pooling equilibrium where everybody scores 0.
- (e) a separating equilibrium where everybody scores 60.

**36.5** A certain city has two kinds of workers, alphas and betas. An alpha can produce \$100 worth of output per day working for himself. If he works in the local factory, he produces \$120 worth of output a day. A beta produces \$60 worth of output per day working for himself and he produces \$80 worth of output per day if he works for the local factory. Workers either work for themselves or work in the factory. The factory owner can't tell alphas from betas. He pays a wage equal to the average product of his labor force and he has at least some alphas working for him. Workers are free to choose to work for themselves or the factory, depending on which offers more money.

- (a) At least  $5/6$  of the factory's employees must be alphas.
- (b) At least half of the factory's employees must be betas.
- (c) At least half of the factory's employees must be alphas.
- (d) None of the factory's employees can be betas.
- (e) No more than  $5/6$  of the betas can work in the factory.

**36.6** Enigma, Ohio, has two kinds of workers, klutzes whose labor is worth \$1,000 a month and kandos whose labor is worth \$2,500 a month. Enigma has exactly twice as many klutzes as kandos. Klutzes look just like kandos and are accomplished liars, so if you ask, they claim to be kandos. It is too expensive to monitor anybody's work. A professor who likes to talk offers to give free lectures on personal hygiene and macroeconomics. Klutzes and kandos find these lectures excruciatingly dull. An hour's lecture is as bad as losing \$50 for a kando and as bad as losing \$100 for a klutz. If all other firms pay wages equal to the productivity of an average citizen of Enigma, which of these strategies would be most profitable for a new firm?

- (a) Offer a wage of \$2000 per month and require its workers to listen to 6 hours of lectures per month.
- (b) Offer a wage of \$2000 per month and require its workers to listen to 4 hours of lectures per month.
- (c) Offer a wage of \$1750 per month and require its workers to listen to 6 hours of lectures per month.
- (d) Offer a wage of \$1660 per month and require its workers to attend 1 hour of lectures per month.
- (e) Offer a wage of \$2600 per month and require its workers to attend 8 hours of lectures per month.

**36.7** Jan's utility function is  $C - H^2$ , where  $C$  is consumption and  $H$  is hours worked per day. She can work in the city for 8 hours per day, earning \$100 a day. Alternatively, she can rent a small farm from the landlord, Mr. Porksniffer. If she rents the farm, she can work as many hours a day as she wishes. If she works  $H$  hours per day, she can sell her crops for a total of  $\$20H$  per day, but she must pay Mr. Porksniffer an annual rent of  $\$R$ . Mr. Porksniffer wants to charge the highest rent  $\$R$  that he can and still be able to get Jan to work for him. What is the highest rent he can charge? A penny less than:

- (a) \$100 per day.
  - (b) \$64 per day.
  - (c) \$60 per day.
  - (d) \$50 per day.
  - (e) \$36 per day.

**2.7C** In the economy of Mungo, discussed in Problem 2.12, there is a third person called Ike. Ike has a red income of 80 and a blue income of 30. (Recall that blue ices are 1 bcu (blue currency unit) per unit of ambrosia and 1 bcu  $p p$  per unit of bubblegum. Red prices are 2 rcus (red currency units) per unit of ambrosia and 6 rcus per unit of bubblegum. You have to pay twice for what you buy, once in red currency, once in blue currency.) If Ike spends all of its blue income, but not all of its red income, then it must be that

- (a) it consumes at least 5 units of bubblegum.
  - (b) it consumes at least 25 units of ambrosia.
  - (c) it consumes exactly twice as much bubblegum as ambrosia.
  - (d) it consumes at least 9 units of bubblegum.
  - (e) it consumes equal amounts of ambrosia and bubblegum.

**3.3D** In Problem 3.8, Nancy Lerner is taking a course from Professor Goodheart who will count only her best midterm grade and from Professor Stern who will count only her worst midterm grade. In one of her classes, Nancy has scores of 20 on her first midterm and 40 on her second midterm. When the first midterm score is measured on the horizontal axis and her second midterm score on the vertical, her indifference curve has a slope of zero at the point (20, 40). Therefore it must be that

- (a) this class could be Professor Goodheart's, but couldn't be Professor Stern's.
  - (b) this class could be Professor Stern's, but couldn't be Professor Goodheart's.
  - (c) this class couldn't be either Goodheart's or Stern's.
  - (d) this class could be either Goodheart's or Stern's.
  - (e) there is not enough information to tell whose class it could or couldn't be

**4.5D** In Problem 4.7, Harry Mazzola has the utility function  $U(x_1, x_2) = \min\{x_1 + 2x_2, 2x_1 + x_2\}$ . He has \$40 to spend on corn chips and french fries, if the price of corn chips is 2 dollar(s) per unit and the price of french fries is 4 dollars per unit, then Harry will

- (a) definitely spend all of his income on corn chips.
- (b) definitely spend all of his income on french fries.
- (c) consume at least as much corn chips as french fries, but might consume both.
- (d) consume at least as much french fries as corn chips, but might consume both.
- (e) consume equal amounts of french fries and corn chips.

% Correct Responses: 86

Discrimination Index: 33

Correct Answer: B

**4.2E** In Problem 4.1, Charlie's utility function is  $U(A, B) = AB$  where  $A$  and  $B$  are the numbers of apples and bananas, respectively, that he consumes. When Charlie is consuming 25 apples and 125 bananas, then if we put apples on the horizontal axis and bananas on the vertical axis, the slope of his indifference curve at his current consumption is

- (a)  $-26$ .
  - (b)  $-5$ .
  - (c)  $-10$ .
  - (d)  $-1/5$ .
  - (e)  $-1/10$ .

# Chapter 6

## Multiple Choice

## Demand

---

Topic: Demand

Difficulty: 0

% Correct Responses: 88

Discrimination Index: 38

Correct Answer: A

**6.1A** In Problem 6.1, if Charlie's utility function were  $X_A^6 X_B$ , if apples cost 40 cents each and bananas cost 10 cents each, Charlie's budget line would be tangent to one of his indifference curves whenever the following equation is satisfied:

(a)  $6X_B = 4X_A$

(b)  $X_B = X_A$

(c)  $X_A = 6X_B$

(d)  $X_B = 6X_A$

(e)  $40X_A + 10X_B = M$

Correct Answer: D

**6.2A** In Problem 6.1, if Charlie's utility function were  $X_A^2 X_B$ , if the price of apples were  $p_A$ , the price of bananas were  $p_B$ , and his income were  $m$ , then Charlie's demand for apples would be

(a)  $m/(2p_A)$ .

(b)  $0.50p_A m$ .

(c)  $m/(p_A + p_B)$ .

(d)  $0.67m/p_A$ .

(e)  $1.50p_B m/p_A$ .

**9.2C** Suppose that Mario in Problem 9.2 consumes eggplant and tomatoes in the ratio of one bushel of eggplant per bushel of tomatoes. His garden yields 30 bushels of eggplant and 10 bushels of tomatoes. He initially faced prices of \$15 per bushel for each vegetable, but the price of eggplant rose to \$60 per bushel, while the price of tomatoes stayed unchanged. After the price change, he would

- (a) increase his eggplant consumption by 6 bushels.
  - (b) decrease his eggplant consumption by at least 6 bushels.
  - (c) increase his consumption of eggplant by 8 bushels.
  - (d) decrease his consumption of eggplant by 8 bushels.
  - (e) decrease his tomato consumption by at least 1 bushel.

Correct Answer: A

**10.7A** Let  $i$  be the rate of inflation and  $r$  the nominal interest rate. (We use  $\pi$  to denote the rate of inflation in the book.) The (exact) real rate of interest is given by:

(a)  $(r - i)/(i + 1)$

(b)  $(r + i)/(i + 1)$

(c)  $(r + i)/(i - 1)$

(d)  $(r - i)/(i - 1)$

(e)  $r - i/r$

**11.2E** Chillingsworth, from Problem 11.10 has a neighbor, Shivers, who faces the same options for insulating his house as Chillingsworth. But Shivers has a larger house. Shivers' annual fuel bill for home heating is 1,200 dollars per year. Plan A will reduce his annual fuel bill by 15%, plan B will reduce it by 20%, and plan C will eliminate his need for heating fuel altogether. The Plan A insulation job would cost Shivers 1,200 dollars, Plan B would cost him 1,700 and Plan C would cost him 13,200 dollars. If the interest rate is 10% and his house and the insulation job last forever, which plan is the best for Shivers?

- (a) Plan A.
  - (b) Plan B.
  - (c) Plan C.
  - (d) Plans A and B are equally good.
  - (e) He is best off using none of the plans.

**12.1E** In Problem 12.9, Billy has a von Neumann-Morgenstern utility function  $U(c) = c^{1/2}$ . If Billy is not injured this season, he will receive an income of 4 million dollars. If he is injured, his income will be only \$10,000. The probability that he will be injured is .1 and the probability that he will not be injured is .9. His expected utility is

- (a) 1,810
  - (b) between 3 million and 4 million dollars.
  - (c) 100,000.
  - (d) 3,620
  - (e) 7,240

**12.2E** (See Prob 12.2) Willy's only source of wealth is his chocolate factory. He has the utility function  $pc_f^{1/2} + (1-p)c_{nf}^{1/2}$  where  $p$  is the probability of a flood,  $1-p$  is the probability of no flood and where  $c_f$  and  $c_{nf}$  are his wealth contingent on a flood and on no flood, respectively. The probability of flood is  $p = 1/18$ . The value of Willy's factory is \$900,000 if there is no flood and 0 if there is a flood. Willy can buy insurance where if he buys  $\$x$  worth of insurance, he must pay the insurance company  $\$3x/20$  whether there is a flood or not, but he gets back  $\$x$  from the company if there is a flood. Willy should buy

- (a) no insurance since the cost per dollar of insurance exceeds the probability of a flood.
  - (b) enough insurance so that if there is a flood, after he collects his insurance his wealth will be 1/9 of what it would be if there is no flood.
  - (c) enough insurance so that if there is a flood, after he collects his insurance, his wealth will be the same whether there is a flood or not.
  - (d) enough insurance so that if there is a flood, after he collects his insurance, his wealth will be 1/4 of what it would be if there is no flood.
  - (e) enough insurance so that if there is a flood, after he collects his insurance his wealth will be 1/7 of what it would be if there is no flood.

**12.3E** Sally Kink is an expected utility maximizer with utility function  $pu(c_1) + (1-p)u(c_2)$  where for any  $x < 3,000$ ,  $u(x) = 2x$  and where  $u(x) = 6,000 + x$  for  $x$  greater than or equal to 3,000.

- (a) Sally will be risk averse if her income is less than 3,000 but risk loving if her income is more than 3,000.
- (b) Sally will be risk neutral if her income is less than 3,000 and risk averse if her income is more than 3,000.
- (c) For bets that involve no chance of her wealth exceeding 3,000, Sally will take any bet that has a positive expected net payoff.
- (d) Sally will never take a bet if there is a chance that it leaves her with wealth less than 6,000.
- (e) None of the above are true.

**12.5E** Clancy has \$5,000. He plans to bet on a boxing match between Sullivan and Flanagan. He finds that he can buy coupons for \$5 that will pay off \$10 each if Sullivan wins. He also finds in another store some coupons that will pay off \$10 if Flanagan wins. The Flanagan tickets cost \$5 each. Clancy believes that the two fighters each have a probability of  $1/2$  of winning. Clancy is a risk averter who tries to maximize the expected value of the natural log of his wealth. Which of the following strategies would maximize his expected utility?

- (a) Don't gamble at all.
  - (b) Buy 500 Sullivan tickets and 500 Flanagan tickets.
  - (c) Buy exactly as many Flanagan tickets as Sullivan tickets.
  - (d) Buy 250 Sullivan tickets and 250 Flanagan tickets.
  - (e) Buy 250 Sullivan tickets and 500 Flanagan tickets.

**14.3D** Bernice in Problem 14.5 has the utility function  $u(x, y) = \min\{x, y\}$  where  $x$  is the number of pairs of earrings she buys per week and  $y$  is the number of dollars per week she has left to spend on other things. (We allow the possibility that she buys fractional numbers of pairs of earrings per week.) If she originally had an income of \$10 per week and was paying a price of \$3 per pair of earrings, then if the price of earrings rose to \$8, the compensating variation of that price change (measured in dollars per week) would be closest to

- (a) \$5.56.
  - (b) \$12.50.
  - (c) \$26.
  - (d) \$25.
  - (e) \$24.

### 17.1A

First Fiddler's Bank has foreclosed on a home mortgage and is selling the house at auction. There are three bidders for the house, Jesse, Shelia, and Elsie. First Fiddler's does not know the willingness to pay of any of these bidders but on the basis of its previous experience believes that each of them has a probability of  $1/3$  of valuing the house at \$900,000, a probability of  $1/3$  of valuing it at \$600,000, and a probability of  $1/3$  of valuing it at \$200,000. First Fiddler's believes that these probabilities are independent between buyers. If First Fiddler's sells the house by means of a second-bidder, sealed-bid auction (Vickrey auction), what will be the bank's expected revenue from the sale? (Choose the closest answer.)

- (a) \$600,000
- (b) \$750,000
- (c) \$566,666.67
- (d) \$400,000
- (e) \$500,000

### 17.2A

An antique cabinet is being sold by means of an English auction. There are four bidders, Hester, Arabella, Gloria, and Desiree. These bidders are unacquainted with each other and do not collude. Hester values the cabinet at \$1,200, Arabella values it at 500, Linda values it at \$1,400, and Eva values it at \$700. If the bidders bid in their rational self-interest, the cabinet will be sold to

- (a) Gloria for about \$1,400.
  - (b) Hester for about \$1,200.
  - (c) either Gloria or Hester for about \$1,200. Which of these two buyers gets it is randomly determined.
  - (d) Gloria for slightly more than \$1,200.
  - (e) either Gloria or Hester for about 500. Which of these two buyers gets it is randomly determined.

**17.4C** A dealer decides to sell an oil painting by means of an English auction with a reservation price of slightly below \$65,000. If she fails to get a bid as high as her reservation price, she will burn the painting. There are two bidders. The dealer believes that each bidder's willingness to pay will take one of the three following values: \$80,000, \$65,000, and \$25,000. The dealer believes that each bidder has a probability of  $\frac{1}{3}$  of having each of these three values. The probability distribution of each buyer's value is independent of that of the other's. Assuming that the two bidders bid rationally and do not collude, the dealer's expected revenue from selling the painting is slightly less than

- (a) \$59,000.
  - (b) \$65,000.
  - (c) \$72,500.
  - (d) \$50,000.
  - (e) \$56,666.67.

**17.5C** Jerry's Auction House in Purloined Hubcap, Oregon, holds sealed-bid used-car auctions every Wednesday. Each car is sold to the highest bidder at the second-highest bidder's bid. On average, two thirds of the cars that are auctioned are lemons and one third are good used cars. A good used car is worth \$1,200 to any buyer. A lemon is worth \$270 to any buyer. Most buyers can do no better than picking at random from among these used cars. The only exception is Al Crankcase. Recall that Al can sometimes detect lemons by tasting the oil on the car's dipstick. A good car never fails Al's test, but half of the lemons fail his test. Al attends every auction, licks every dipstick, and bids his expected value of every car given the results of his test. Al will bid

- (a) \$735 for cars that pass his test and \$270 for cars that fail his test. Normal bidders will get only lemons.
  - (b) \$600 for cars that pass his test and \$400 for cars that fail his test. Normal bidders will get only lemons.
  - (c) \$400 for cars that pass his test and \$270 for cars that fail his test. Normal bidders will get good cars only 1/6 of the time.
  - (d) \$580 for cars that pass his test and \$370 for cars that fail his test. Normal bidders will get good cars only 1/6 of the time.
  - (e) \$540 for cars that pass his test and \$270 for cars that fail his test. Normal bidders will get good cars only 1/12 of the time.

## 17.1D

First Fiddler's Bank has foreclosed on a home mortgage and is selling the house at auction. There are three bidders for the house, Jesse, Shelia, and Elsie. First Fiddler's does not know the willingness to pay of any of these bidders but on the basis of its previous experience believes that each of them has a probability of  $1/3$  of valuing the house at \$500,000, a probability of  $1/3$  of valuing it at \$300,000, and a probability of  $1/3$  of valuing it at \$200,000. First Fiddler's believes that these probabilities are independent between buyers. If First Fiddler's sells the house by means of a second-bidder, sealed-bid auction (Vickrey auction), what will be the bank's expected revenue from the sale? (Choose the closest answer.)

- (a) \$300,000
  - (b) \$400,000
  - (c) \$333,333.33
  - (d) \$250,000
  - (e) \$266,666.67

## 17.2D

An antique cabinet is being sold by means of an English auction. There are four bidders, Judy, Mary, Cindy, and Kitty. These bidders are unacquainted with each other and do not collude. Judy values the cabinet at \$1,200, Mary values it at 500, Linda values it at \$1,700, and Eva values it at \$600. If the bidders bid in their rational self-interest, the cabinet will be sold to

- (a) Cindy for about \$1,700.
  - (b) Judy for about \$1,200.
  - (c) either Cindy or Judy for about \$1,200. Which of these two buyers gets it is randomly determined.
  - (d) Cindy for slightly more than \$1,200.
  - (e) either Cindy or Judy for about 500. Which of these two buyers gets it is randomly determined.

**18.3D** A firm uses 3 factors of production. Its production function is  $f(x, y, z) = \min\{x^2/y, y^1, (z^3 - x^3)/y^2\}$ . If the amount of each input is multiplied by 3, its output will be multiplied by

- (a) 9.
  - (b) 3.
  - (c) 1.
  - (d) 0.75.
  - (e) The answer depends on the original choice of  $x$ ,  $y$ , and  $z$ .

**24.3A** A profit-maximizing monopoly faces an inverse demand function described by the equation  $p(y) = 70 - y$  and its total costs are  $c(y) = 7y$ , where prices and costs are measured in dollars. In the past it was not taxed, but now it must pay a tax of 6 dollars per unit of output. After the tax, the monopoly will

- (a) increase its price by 6.
  - (b) increase its price by 9.
  - (c) increase its price by 3.
  - (d) leave its price constant.
  - (e) None of the other options are correct.
- 

Topic: monopoly  
% Correct Responses: 0  
Correct Answer: B

Difficulty: 3  
Discrimination Index: 0

**24.4A** A firm has invented a new beverage called Slops. It doesn't taste very good, but it gives people a craving for Lawrence Welk's music and Professor Johnson's jokes. Some people are willing to pay money for this effect, so the demand for Slops is given by the equation  $q = 12 - p$ . Slops can be made at zero marginal cost from old-fashioned macroeconomics books dissolved in bathwater. But before any Slops can be produced, the firm must undertake a fixed cost of 41. Since the inventor has a patent on Slops, it can be a monopolist in this new industry.

- (a) The firm will produce 6 units of Slops.
  - (b) A Pareto improvement could be achieved by having the government pay the firm a subsidy of 46 and insisting that the firm offer Slops at zero price.
  - (c) From the point of view of social efficiency, it is best that no Slops be produced.
  - (d) The firm will produce 12 units of Slops.
  - (e) None of the other options are correct.
-

---

Topic: monopoly

**25.3D** A price-discriminating monopolist sells in two separate markets such that goods sold in one market are never resold in the other. It charges 6 in one market and 12 in the other market. At these prices, the price elasticity in the first market is  $-2.40$  and the price elasticity in the second market is  $-0.70$ . Which of the following actions is sure to raise the monopolists profits?

- (a) Lower  $p_2$ .
- (b) Raise  $p_2$ .
- (c) Raise  $p_1$  and lower  $p_2$ .
- (d) Raise both  $p_1$  and  $p_2$ .
- (e) Raise  $p_2$  and lower  $p_1$ .

**25.4D** Suppose that 1,500 people are interested in attending ElvisLand. Once a person arrives at ElvisLand, his or her demand for rides is given by  $x = \text{Max}\{4 - p, 0\}$  where  $p$  is the price per ride. There is a constant marginal cost of \$3 for providing a ride at Elvisland. If ElvisLand charges a profit-maximizing two-part tariff, with one price for admission to ElvisLand and another price per ride for those who get in. How much should it charge per ride and how much for admission?

- (a) \$3 per ride and \$4 for admission.
  - (b) \$3 per ride and \$0.50 for admission.
  - (c) \$0 per ride and \$1 for admission.
  - (d) \$0 per ride and \$3.50 for admission.
  - (e) \$4 per ride and \$4 for admission.

**28.1C** (See Problem 28.1) Big Pig and Little Pig have two possible strategies, Press the Button, and Wait at the trough. If both pigs choose Wait, both get 3. If both pigs press the button then Big Pig gets 8 and Little Pig gets 2. If Little Pig presses the button and Big Pig waits at the trough, then Big Pig gets 10 and Little Pig gets 0. Finally, if Big Pig presses the button and Little Pig waits, then Big Pig gets 2 and Little Pig gets 1. In Nash equilibrium,

- (a) Little Pig will get a payoff of 1 and Big Pig will get a payoff of 2.
  - (b) Little Pig will get a payoff of 2 and Big Pig will get a payoff of 8.
  - (c) Both pigs will wait at the trough.
  - (d) Little pig will get a payoff of zero.
  - (e) The pigs must be using mixed strategies.

**28.2C** (See Problem 28.6) Two players are engaged in a game of "chicken". There are two possible strategies. Swerve and Drive Straight. A player who chooses to Swerve is called "Chicken" and gets a payoff of zero, regardless of what the other player does. A player who chooses to Drive Straight gets a payoff of 18 if the other player swerves and a payoff of  $-12$  if the other player also chooses to Drive Straight. This game has two pure strategy equilibria and

- (a) a mixed strategy equilibrium in which each player swerves with probability 0.40 and drives straight with probability 0.60.
  - (b) two mixed strategies in which players alternate between swerving and driving straight.
  - (c) a mixed strategy equilibrium in which one player swerves with probability 0.40 and the other swerves with probability 0.60.
  - (d) a mixed strategy in which each player swerves with probability 0.20 and drives straight with probability 0.80.
  - (e) no mixed strategies.

**28.3C** The old Michigan football coach had only two strategies. Run the ball to the left side of the line. Run the ball to the right side. The defense can concentrate either on the left side or the right side of Michigan's line. If the opponent concentrates on the wrong side, Michigan is sure to gain at least 5 yards. If the defense defended the left side and Michigan ran left, Michigan would be stopped for no gain. But if the opponent defended the right side when Michigan ran right, Michigan would still gain at least 5 yards with probability 0.40. It is the last play of the game and Michigan needs to gain 5 yards to win. Both sides choose Nash equilibrium strategies. In Nash equilibrium, Michigan would

- (a) be sure to run to the right side.
  - (b) run to the right side with probability 0.63.
  - (c) run to the right side with probability 0.77.
  - (d) run to the two sides with equal probability.
  - (e) run to the right side with probability 0.60.

**30.4C** (See Problem 30.2) Robinson Crusoe has exactly 8 hours per day to spend gathering coconuts or catching fish. He can catch 4 fish per hour or he can pick 8 coconuts per hour. His utility function is  $U(F, C) = FC$  where  $F$  is his consumption of fish and  $C$  is his consumption of coconuts. If he allocates his time in the best possible way between catching fish and picking coconuts, his consumption will be the same as it would be if he could buy fish and coconuts in a competitive market where the price of coconuts is 1,

- (a) his income is 64, and the price of fish is 2.
- (b) his income is 32, and the price of fish is 4.
- (c) his income is 96 and the price of fish is 4.
- (d) his income is 64 and the price of fish is 0.25.
- (e) his income is 48 and the price of fish is 0.25.

**30.5C** On a certain island there are only two goods, wheat and milk. The only scarce resource is land. There are 1000 acres of land. An acre of land will produce either 11 units of milk or 22 units of wheat. Some citizens have lots of land, some have just a little bit. The citizens of the island all have utility functions of the form  $U(M, W) = MW$ . At every Pareto optimal allocation,

- (a) the number of units of milk produced equals the number of units of wheat produced.
  - (b) total milk production is 5,500.
  - (c) all citizens consume the same commodity bundle.
  - (d) every consumer's marginal rate of substitution between milk and wheat is  $-1$ .
  - (e) None of the above is true at EVERY Pareto optimal allocation.

% Correct Responses: 0

Discrimination Index: 0

Correct Answer: D

**34.3A** Professor Kremepuff's new, user-friendly textbook has just been published. This book will be used in classes for two years, after which it will be replaced by a new edition. The publisher charges a price of  $p_1$  in the first year and  $p_2$  in the second year. After the first year, bookstores buy back used copies for  $p_2/2$  and resell them to students in the second year for  $p_2$ . (Students are indifferent between new and used copies.) The cost to a student of owning the book during the first year is therefore  $p_1 - (p_2/2)$ . In the first year of publication, the number of students willing to pay  $\$v$  to own a copy of the book for a year is  $80,000 - 1,000v$ . The number of student taking the course in the first year who are willing to pay  $\$w$  to keep the book for reference rather than sell it at the end of the year is  $80,000 - 5,000w$ . The number of persons who are taking the course in the second year and are willing to pay at least  $\$p$  for a copy of the book is  $60,000 - 1,000p$ . If the publisher sets a price of  $p_1$  in the first year and  $p_2 \leq p_1$  in the second year, then the total number of copies of the book that the publisher sells over the two years will be

(a)  $160,000 - 1,000p_1 - 1,000p_2$ .

(b)  $160,000 - 1,000(p_1 - (p_2/2))$ .

(c)  $160,000 - 3,000p_2$ .

(d)  $140,000 - 1,000(p_1 + (p_2/2))$ .

(e)  $140,000 - 1,500p_2$ .

Correct Answer: D

**34.3B** Professor Kremepuff's new, user-friendly textbook has just been published. This book will be used in classes for two years, after which it will be replaced by a new edition. The publisher charges a price of  $p_1$  in the first year and  $p_2$  in the second year. After the first year, bookstores buy back used copies for  $p_2/2$  and resell them to students in the second year for  $p_2$ . (Students are indifferent between new and used copies.) The cost to a student of owning the book during the first year is therefore  $p_1 - (p_2/2)$ . In the first year of publication, the number of students willing to pay  $\$v$  to own a copy of the book for a year is  $70,000 - 2,500v$ . The number of student taking the course in the first year who are willing to pay  $\$w$  to keep the book for reference rather than sell it at the end of the year is  $70,000 - 12,500w$ . The number of persons who are taking the course in the second year and are willing to pay at least  $\$p$  for a copy of the book is  $65,000 - 2,500p$ . If the publisher sets a price of  $p_1$  in the first year and  $p_2 \leq p_1$  in the second year, then the total number of copies of the book that the publisher sells over the two years will be

(a)  $140,000 - 2,500p_1 - 2,500p_2$ .

(b)  $140,000 - 2,500(p_1 - (p_2/2))$ .

(c)  $140,000 - 7,500p_2$ .

(d)  $135,000 - 2,500(p_1 + (p_2/2))$ .

(e)  $135,000 - 3,750p_2$ .

**35.1A** Just north of the town of Muskrat, Ontario, in Problem 35.1, is the town of Brass Monkey, population 8,000. Brass Monkey, like Muskrat, has a single public good, the town skating rink and a single private good, Labatts ale. Everyone's utility function is  $U_i(X_i, Y) = X_i - 81/Y$ , where  $X_i$  is the number of bottles of ale consumed by  $i$  and  $Y$  is the size of the skating rink in square meters. The price of ale is \$1 per bottle. The cost of the skating rink to the city is \$5 per square meter. Everyone has an income of at least \$5,000. What is the Pareto efficient size for the town skating rink?

- (a) 360 square meters.
- (b) 480 square meters.
- (c) 240 square meters.
- (d) 725 square meters.
- (e) None of the other options are correct.

**35.4A** Recall Lucy and Melvin from Problem 35.6. Lucy's utility function is  $2X_L + G$  and Melvin's utility function is  $X_M + G$  where  $G$  is their expenditures on the public goods they share in their apartment and where  $X_L$  and  $X_M$  are their respective private consumption expenditures. The total amount they have to spend on private goods and public goods is 36,000. They agree on a Pareto optimal pattern of expenditures in which the amount that is spent on Lucy's private consumption is 6,000. How much do they spend on public goods?

- (a) 10,000
  - (b) 20,000
  - (c) 8,050
  - (d) 5,000
  - (e) There is not enough information here to be able to determine the answer.

**35.1E** Just north of the town of Muskrat, Ontario, in Problem 35.1, is the town of Brass Monkey, population 3,200. Brass Monkey, like Muskrat, has a single public good, the town skating rink and a single private good, Labatts ale. Everyone's utility function is  $U_i(X_i, Y) = X_i - 121/Y$ , where  $X_i$  is the number of bottles of ale consumed by  $i$  and  $Y$  is the size of the skating rink in square meters. The price of ale is \$1 per bottle. The cost of the skating rink to the city is \$8 per square meter. Everyone has an income of at least \$5,000. What is the Pareto efficient size for the town skating rink?

- (a) 220 square meters.
  - (b) 340 square meters.
  - (c) 170 square meters.
  - (d) 445 square meters.
  - (e) None of the other options are correct.

**35.2E** Recall Bob and Ray in Problem 35.4. They are thinking of buying a sofa. Bob's utility function is  $U_B(S, M_B) = (1+S)M_B$  and Ray's utility function is  $U_R(S, M_R) = (4+S)M_R$ , where  $S = 0$  if they don't get the sofa and  $S = 1$  if they do and where  $M_B$  and  $M_R$  are the amounts of money they have respectively to spend on their private consumptions. Bob has a total of \$1,600 to spend on the sofa and other stuff. Ray has a total of \$ 4,000 to spend on the sofa and other stuff. The maximum amount that they could pay for the sofa and still arrange to both be better off than without it is:

- (a) 2,400
  - (b) 1,000
  - (c) 850
  - (d) 1,600
  - (e) 3,200

**35.3E** Recall Bonnie and Clyde from Problem 35.5. Suppose that their total profits are  $24H$  where  $H$  is the number of hours they work per year. Their utility functions are, respectively,  $U_B(C_B, H) = C_B - 0.02H^2$ , and  $U_C(C_C, H) = C_C - 0.01H^2$ , where  $C_B$  and  $C_C$  are their private goods consumptions and  $H$  is the number of hours they work per year. If they find a Pareto optimal choice of hours of work and income distribution, it must be that the number of hours they work per year is:

- (a) 500
- (b) 600
- (c) 400
- (d) 150
- (e) 250

**35.4E** Recall Lucy and Melvin from Problem 35.6. Lucy's utility function is  $2X_L + G$  and Melvin's utility function is  $X_M G$  where  $G$  is their expenditures on the public goods they share in their apartment and where  $X_L$  and  $X_M$  are their respective private consumption expenditures. The total amount they have to spend on private goods and public goods is 22,000. They agree on a Pareto optimal pattern of expenditures in which the amount that is spent on Lucy's private consumption is 7,000. How much do they spend on public goods?

- (a) 5,000
  - (b) 10,000
  - (c) 6,050
  - (d) 2,500
  - (e) There is not enough information here to be able to determine the answer.

**36.1A** Suppose that low-productivity workers all have marginal products of 10 and high productivity workers have marginal products of 12. The community has equal numbers of each type of worker. The local community college offers a course in microeconomics. High-productivity workers think taking this course is as bad a wage cut of 4 and low-productivity workers think it is as bad as a wage cut 8.

- (a) There is a separating equilibrium in which high-productivity workers take the course and are paid 12 and low-productivity workers do not take the course and are paid 10.
  - (b) There is no separating equilibrium and no pooling equilibrium.
  - (c) There is no separating equilibrium, but there is a pooling equilibrium in which everybody is paid 11.
  - (d) There is a separating equilibrium in which high-productivity workers take the course and are paid 16 and low productivity workers do not take the course and are paid 10.
  - (e) There is a separating equilibrium in which high-productivity workers take the course and are paid 12 and low productivity workers are paid 11.
