Capítulo 9

Propriedades dos gases

$$pV = nRT$$

Equação de estado dos gases ideais

$$\left\{ \begin{array}{l} n = \text{número de moles do gás} \\ R = \text{constante universal dos gases} \end{array} \right.$$

$$R = 8,314 \frac{J}{mol K} = 1,98 \frac{cal}{mol K}$$

$$U = U(T) \quad (\text{gás ideal})$$

U só depende da
temperatura !!!

Entalpia

Entalpia, por vezes referida como **entalpia absoluta**, é uma grandeza física definida no âmbito da **termodinâmica clássica** de forma que esta meça a máxima energia de um sistema termodinâmico, teoricamente passível de ser deste removida na forma de calor. É particularmente útil na compreensão e descrição de **processos isobáricos**:^[1] à pressão constante as variações de entalpia encontram-se diretamente associadas às energias recebidas pelo sistema na forma de calor, as quais são facilmente mensuráveis em **calorímetros**.

do grego "thalpos"

Entalpia

$$\Delta U = -W$$

(processo adiabático)

Entalpia

$$\Delta U = -W \quad (\text{processo adiabático})$$

$$U_f - U_i = -(p_f V_f - p_i V_i) \quad (\text{processos isobáricos})$$

Entalpia

$$\Delta U = -W \quad (\text{processo adiabático})$$

$$U_f - U_i = -(p_f V_f - p_i V_i) \quad (\text{processos isobáricos})$$

$$U_f + p_f V_f = U_i + p_i V_i = \text{constante}$$

Entalpia

$$\Delta U = -W \quad (\text{processo adiabático})$$

$$U_f - U_i = -(p_f V_f - p_i V_i) \quad (\text{processos isobáricos})$$

$$U_f + p_f V_f = U_i + p_i V_i = \text{constante}$$

$$H = U + pV \quad \text{Entalpia do sistema}$$

Entalpia do gás é uma variável de estado !

Primeira Lei e Entalpia

$$H = U + pV$$

Primeira Lei e Entalpia

$$H = U + pV$$

$$dH = dU + pdV + dpV$$

Primeira Lei e Entalpia

$$H = U + pV$$

$$dH = dU + pdV + dpV$$

$$dQ = dU + pdV$$

Primeira Lei e Entalpia

$$H = U + pV$$

$$dH = dU + pdV + dpV$$

$$dQ = dU + pdV$$

$$dH = dQ + dpV$$

Primeira Lei e Entalpia

$$H = U + pV$$

$$dH = dU + pdV + dpV$$

$$dQ = dU + pdV$$

$$dH = dQ + dpV$$

Processo isobárico: $dp = 0$

$$dH = dQ$$

Fórmula de Mayer

Capacidades Térmicas Molares

$$\Delta Q = m c \Delta T = C \Delta T$$

Para um mol de um gás C é a capacidade térmica molar

$$dQ = C dT$$

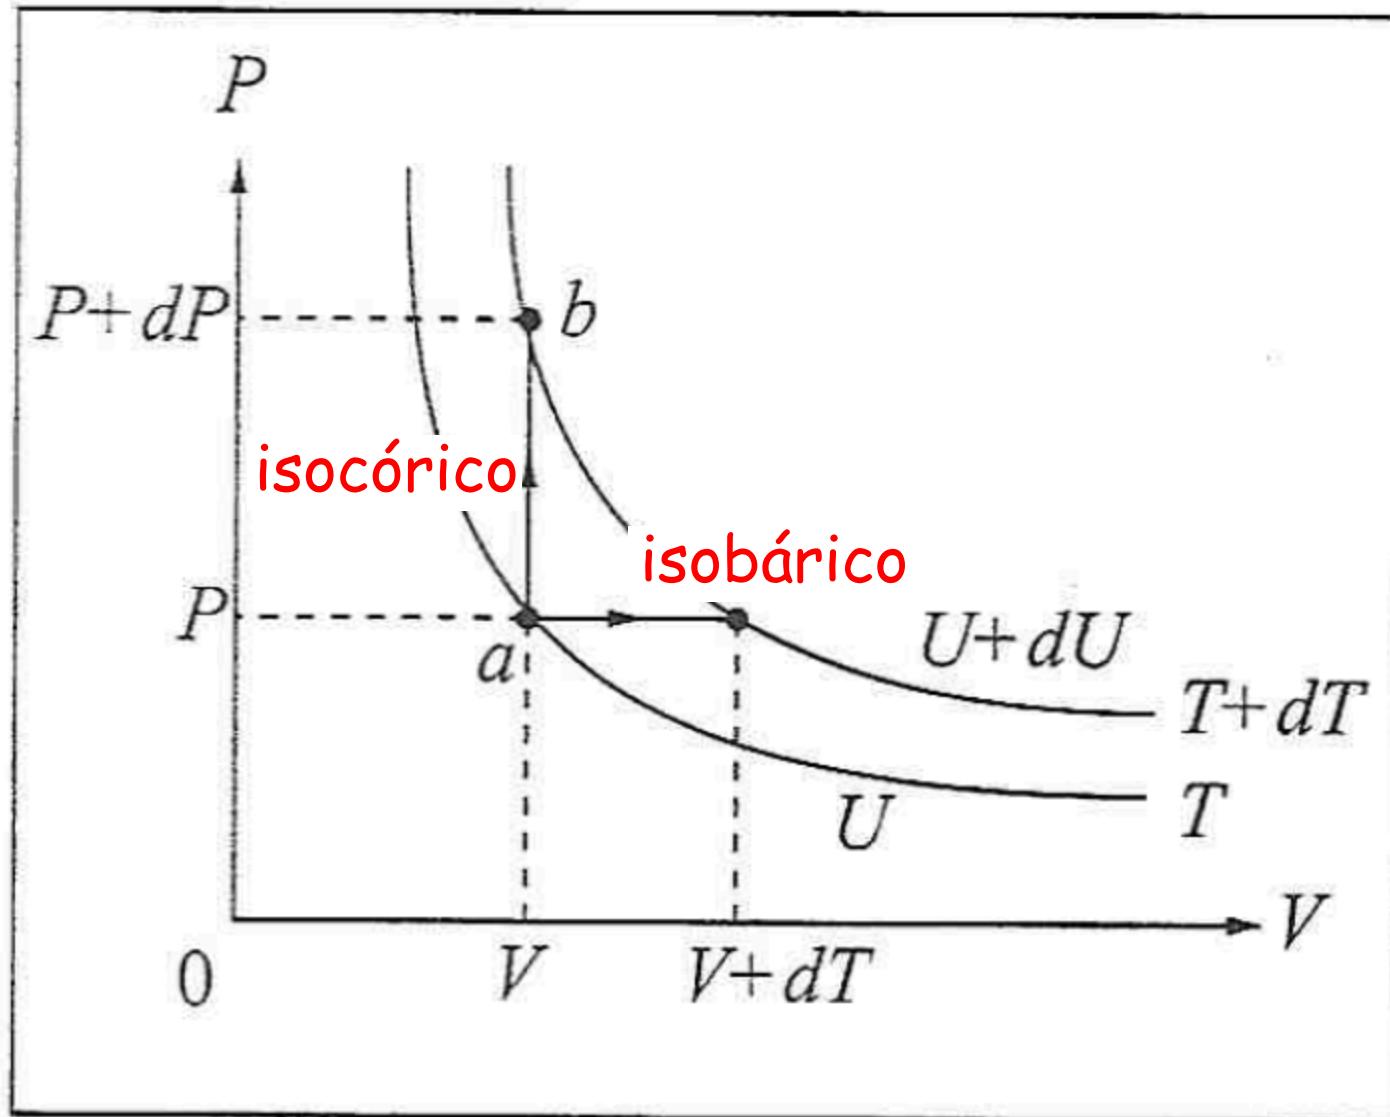

$$dQ_p = C_p dT$$

Pressão constante

$$dQ_V = C_V dT$$

Volume constante

Capacidades Térmicas Molares

$$dQ = dU + pdV$$

$$dQ = dU + pdV \quad \longrightarrow \quad dU = dQ - pdV$$

$$dQ = dU + pdV \quad \xrightarrow{\text{red arrow}} \quad dU = dQ - pdV$$

Processo isocórico: $\left\{ \begin{array}{l} dV = 0 \end{array} \right.$

$$dQ = dU + pdV \quad \xrightarrow{\text{red arrow}} \quad dU = dQ - pdV$$

Processo isocórico:

$$\left\{ \begin{array}{l} dV = 0 \\ dQ = dQ_V = C_V dT \end{array} \right.$$

$$dQ = dU + pdV \quad \xrightarrow{\text{ }} \quad dU = dQ - pdV$$

Processo isocórico:

$$\left\{ \begin{array}{l} dV = 0 \\ dQ = dQ_V = C_V dT \end{array} \right.$$

$$dU = C_V dT$$

$$dQ = dU + pdV \quad \xrightarrow{\hspace{1cm}} \quad dU = dQ - pdV$$

Processo isocórico:

$$\left\{ \begin{array}{l} dV = 0 \\ dQ = dQ_V = C_V dT \end{array} \right.$$

$$dU = C_V dT$$

Processo isobárico:

$$\left\{ \begin{array}{l} dW = pdV \end{array} \right.$$

$$dQ = dU + pdV \quad \xrightarrow{\hspace{1cm}} \quad dU = dQ - pdV$$

Processo isocórico:

$$\left\{ \begin{array}{l} dV = 0 \\ dQ = dQ_V = C_V dT \end{array} \right.$$

$$dU = C_V dT$$

Processo isobárico:

$$\left\{ \begin{array}{l} dW = pdV \\ dQ = dQ_P = C_P dT \end{array} \right.$$

$$dQ = dU + pdV \quad \xrightarrow{\hspace{1cm}} \quad dU = dQ - pdV$$

Processo isocórico:

$$\begin{cases} dV = 0 \\ dQ = dQ_V = C_V dT \end{cases}$$

$$dU = C_V dT$$

Processo isobárico:

$$\begin{cases} dW = pdV \\ dQ = dQ_P = C_P dT \end{cases}$$

$$dU = C_P dT - pdV$$

$$dQ = dU + pdV \quad \longrightarrow \quad dU = dQ - pdV$$

Processo isocórico:

$$\left\{ \begin{array}{l} dV = 0 \\ dQ = dQ_V = C_V dT \end{array} \right.$$

$$dU = C_V dT$$

Processo isobárico:

$$\left\{ \begin{array}{l} dW = pdV \\ dQ = dQ_P = C_P dT \end{array} \right.$$

$$dU = C_P dT - pdV$$

$$C_V dT = C_P dT - pdV$$

Para 1 mol:

$$\left\{ \begin{array}{l} pV = RT \end{array} \right.$$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Processo isobárico: $\left\{ \begin{array}{l} dp = 0 \end{array} \right.$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Processo isobárico: $\left\{ \begin{array}{l} dp = 0 \end{array} \right.$

 $pdV = RdT$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Processo isobárico: $\left\{ \begin{array}{l} dp = 0 \end{array} \right.$

 $pdV = RdT$

$$C_V dT = C_P dT - RdT$$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Processo isobárico: $\left\{ \begin{array}{l} dp = 0 \end{array} \right.$

→ $pdV = RdT$

$$C_V dT = C_P dT - RdT$$

$$C_V = C_P - R$$

Para 1 mol: $\left\{ \begin{array}{l} pV = RT \end{array} \right.$

$$dpV + pdV = RdT$$

Processo isobárico: $\left\{ \begin{array}{l} dp = 0 \end{array} \right.$

→ $pdV = RdT$

$$C_V dT = C_P dT - RdT$$

$$C_V = C_P - R$$

$$C_P - C_V = 2 \frac{cal}{molK}$$

Fórmula
de Mayer

A energia interna
cresce **linearmente**
com a temperatura !

Quer ver ?

Energia Interna do Gás Ideal

$$dU = C_V dT \quad (\text{para 1 mol})$$

$$dU = n C_V dT \quad (\text{para } n \text{ moles})$$

$$\int_{T_0}^T U(T') dT' = n \int_{T_0}^T C_V dT'$$

Para um gás ideal C_V é constante !

$$U = U_0 + n C_V T$$

$$pV^\gamma = \text{constante}$$

Quer ver ?

Processos Adiabáticos num Gás Ideal

$$dQ = dU + p dV$$

Processos Adiabáticos num Gás Ideal
