

Pre-existing differences in fertility signals give workers the upper hand in reproductive hierarchies of Neoponera apicalis

Honorio Romain<sup>1</sup>, Chameron Stéphane<sup>2</sup> & Châline Nicolas<sup>3</sup>

## Introduction

*i*EES Paris

- Social insects  $\rightarrow$  Division of labour (queen caste : reproduction ; worker caste : ergonomic tasks)
- In most ants species, when the queen dies, workers produce males to increase their fitness  $\rightarrow$  conflicts between workers to produce males.

- Establishment of a hierarchy based on interactions and idiosyncratic variations  $\rightarrow$  Differences in ovarian activity between workers in the queen's presence
- Correlation between fertility cuticular and hydrocarbons  $\rightarrow$  allows rapid establishment of hierarchies ?
- Do workers with the most developed ovaries become higher rankers in the reproductive hierarchy?

## **Results & Discussion**

Agonistic behaviours per observation days.

## **Material and Methods**

apicalis Neoponera collected in Belém, Para, Brazil: 4 colonies.

Agonistic

(hierarchical rank)

Final profile extraction

(GC-MS) + Dissection

(ovarian development)

Sacrifice

SORBONNE

Fertility as a function of tricosane (c23) at the end and at the beginning of the experiment

## Acknowledgements

We thank Ronara De Souza Ferreira-Châline and Rémi Gouttefarde for collecting ants, Chloé Leroy for chemical analyses, Chantal Poteaux-Léonard for genetic analyses and Devienne Paul for technical assistance.

Proportion of c23 initial

Deviation from mean of initial c23 proportion

Same correlations with final observations and final c23.

Tricosane (cuticular hydrocarbon ; C23) : correlated with both fertility and agonistic behaviours  $\rightarrow$  Putative **fertility signal** in our model species.

- Strong link between behaviour, fertility and chemistry.
- Chemical heterogeneity between workers in queenright conditions
- $\rightarrow$  Difference in ovarian activity, facilitates the rapid establishment of hierarchy.
- Workers whose ovaries are already active reach the higher hierarchical ranks.
- $\rightarrow$  Reduced costs associated with fighting, faster production of males (limited time once orphaned colony).

Quantity of c23 final (µg)
