**É o cidadão bem-comportado**

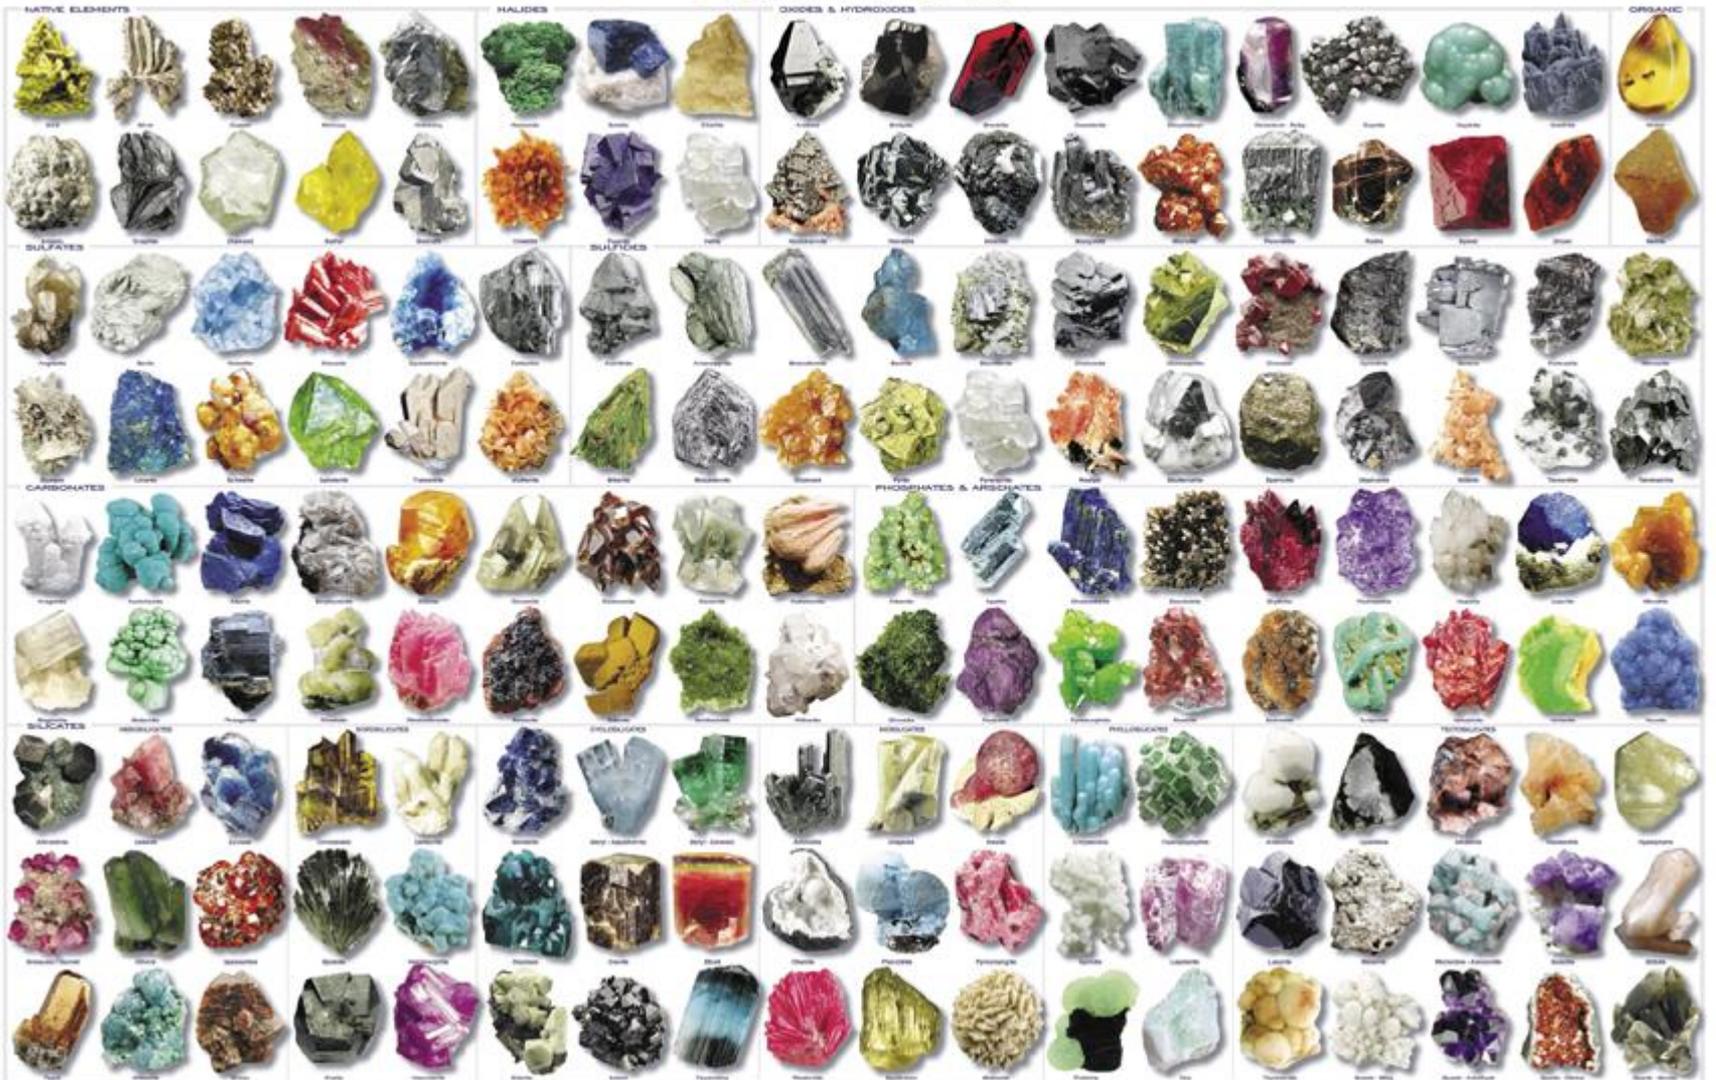

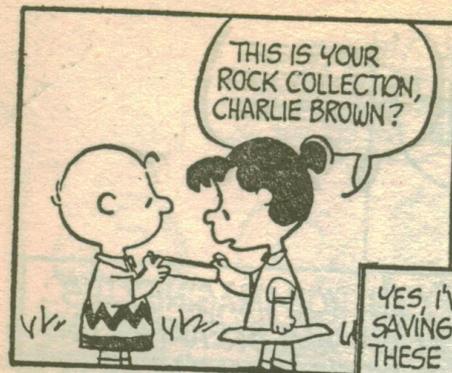

# MINERALS

**PROPRIEDADES  
FÍSICAS  
DOS  
MINERAIS**

**Daniel Atencio**

# PROPRIEDADES

- Hábito
- Clivagem
- Brilho
- Transparência
- Dureza
- Cor e cor do traço
- Densidade relativa
- Propriedades organolépticas
- Propriedades magnéticas

# COR

- Resulta da absorção seletiva da luz
- É determinada por vários fatores
- O principal fator é a composição química (elementos químicos de transição: Fe, Cu, Ni, Cr, V...)
- Alguns elementos podem dar um forte efeito na cor mesmo em pequenas quantidades por substituição iônica

Table 6.2

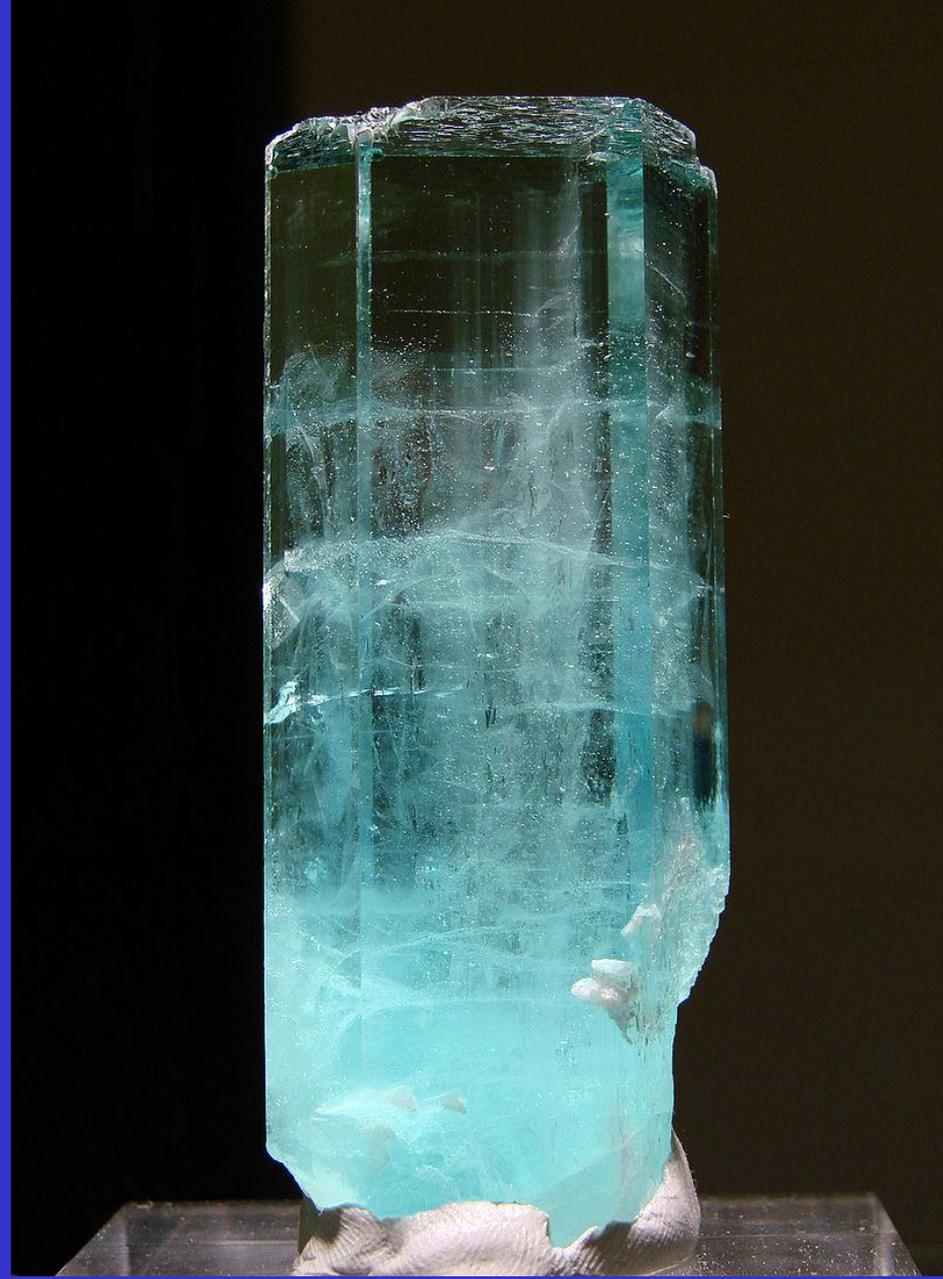

**EXAMPLES OF COMMON MINERALS WHOSE COLOR IS DUE TO THE INTERACTION OF TRANSITION ELEMENTS AND CRYSTAL FIELD TRANSITIONS\***

Absorbing Ion	Mineral	Formula	Color
Cr <sup>3+</sup>	Beryl (emerald)	Be <sub>3</sub> Al <sub>2</sub> Si <sub>6</sub> O <sub>18</sub>	Green
	Corundum (ruby)	Al <sub>2</sub> O <sub>3</sub>	Red
Mn <sup>3+</sup>	Tourmaline (rubellite)	Na(Li,Al) <sub>3</sub> Al <sub>6</sub> (BO <sub>3</sub> ) <sub>3</sub> (Si <sub>6</sub> O <sub>18</sub> )OH <sub>4</sub>	Pink
Mn <sup>2+</sup>	Beryl (morganite)	Be <sub>3</sub> Al <sub>2</sub> Si <sub>6</sub> O <sub>18</sub>	Pink
	Spessartine garnet	Mn <sub>3</sub> Al <sub>2</sub> (SiO <sub>4</sub> ) <sub>3</sub>	Yellow-orange
Fe <sup>3+</sup>	Andradite garnet	Ca <sub>3</sub> Fe <sub>2</sub> (SiO <sub>4</sub> ) <sub>3</sub>	Green
	Chrysoberyl	BeAl <sub>2</sub> O <sub>4</sub>	Yellow
Fe <sup>2+</sup>	Olivine (peridot)	(Mg,Fe) <sub>2</sub> SiO <sub>4</sub>	Yellow-green
	Almandine garnet	Fe <sub>3</sub> Al <sub>2</sub> (SiO <sub>4</sub> ) <sub>3</sub>	Dark red
Cu <sup>2+</sup>	Turquoise	CuAl <sub>6</sub> (PO <sub>4</sub> ) <sub>4</sub> (OH) <sub>8</sub> ·5H <sub>2</sub> O	Light blue

\*From Loeffler, B. M. and Burns, R. G., 1976, Shedding light on the color of gems and minerals. *American Scientist*, v. 64, pp. 636-647. Many of the minerals listed in the table are illustrated in Plates I through IV, Chapter 15.

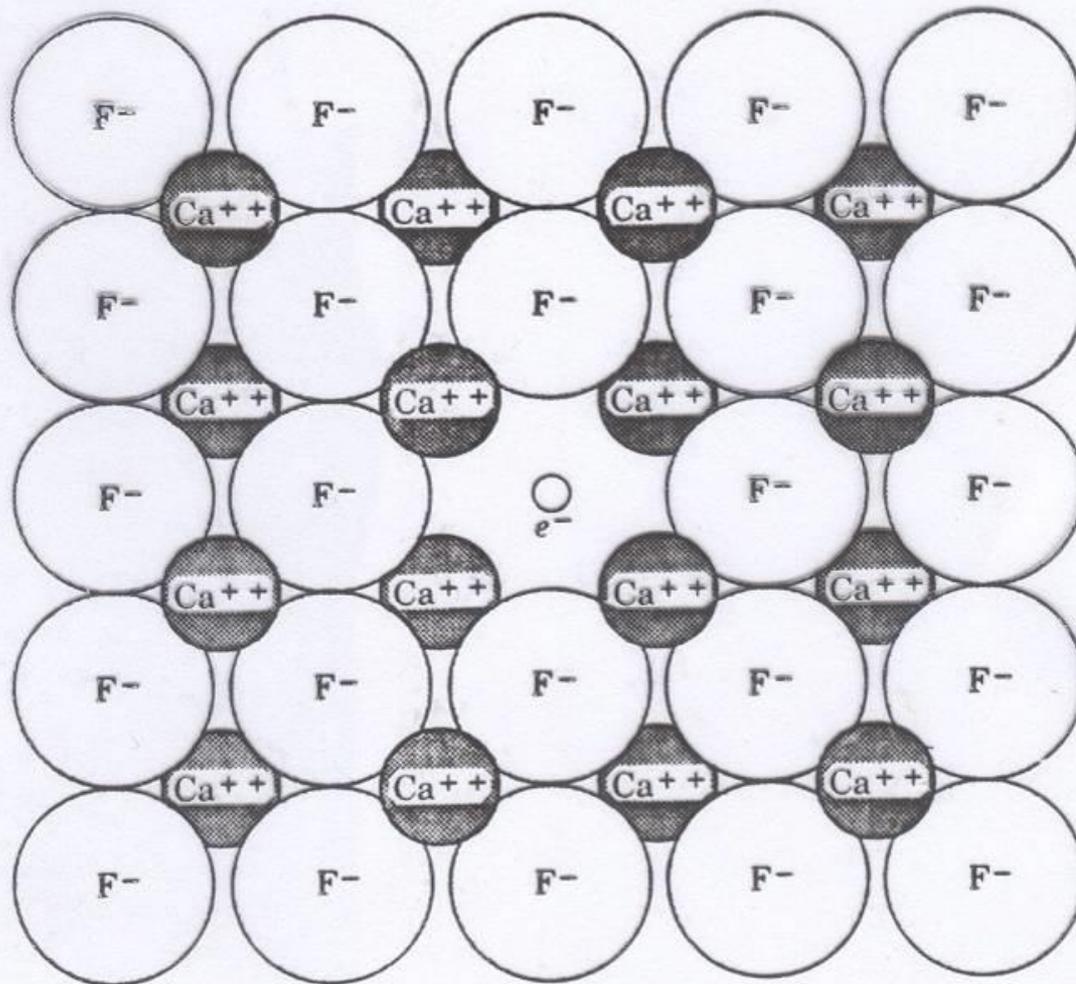

esmeralda (berilo)

água marinha (berilo)

FIG. 6.19. Schematic illustration of the structure of fluorite,  $\text{CaF}_2$ , in which an electron fills a vacancy created by a fluorine ion that was removed. Here a color center is the result of the electron taking the place of the dislodged ion. (Adapted from Nassau, K., *The Causes of Color*. *Scientific American*, v. 243, pp. 124–156. Copyright © 1980 by Scientific American, Inc. All rights reserved.)

- *Minerais idiocromáticos*: têm cores bastante características, por exemplo, o enxofre.
- *Minerais alocromáticos*: a cor varia amplamente, por exemplo, quartzo e fluorita.

1 cm

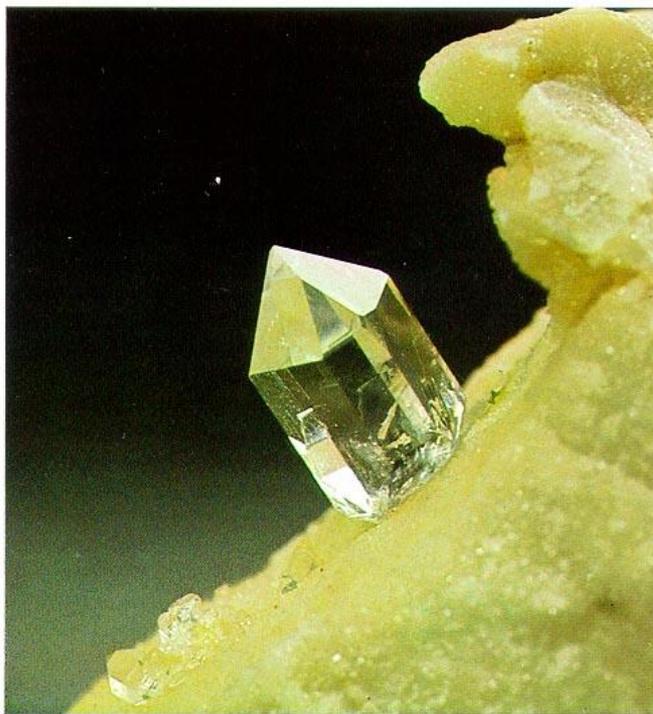

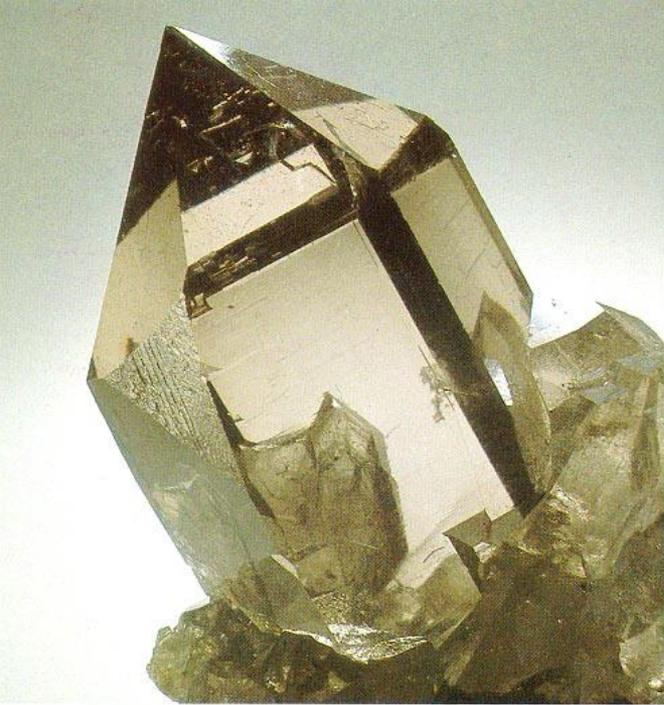

Enxofre

Fluorita

# Quartzo

Azurita

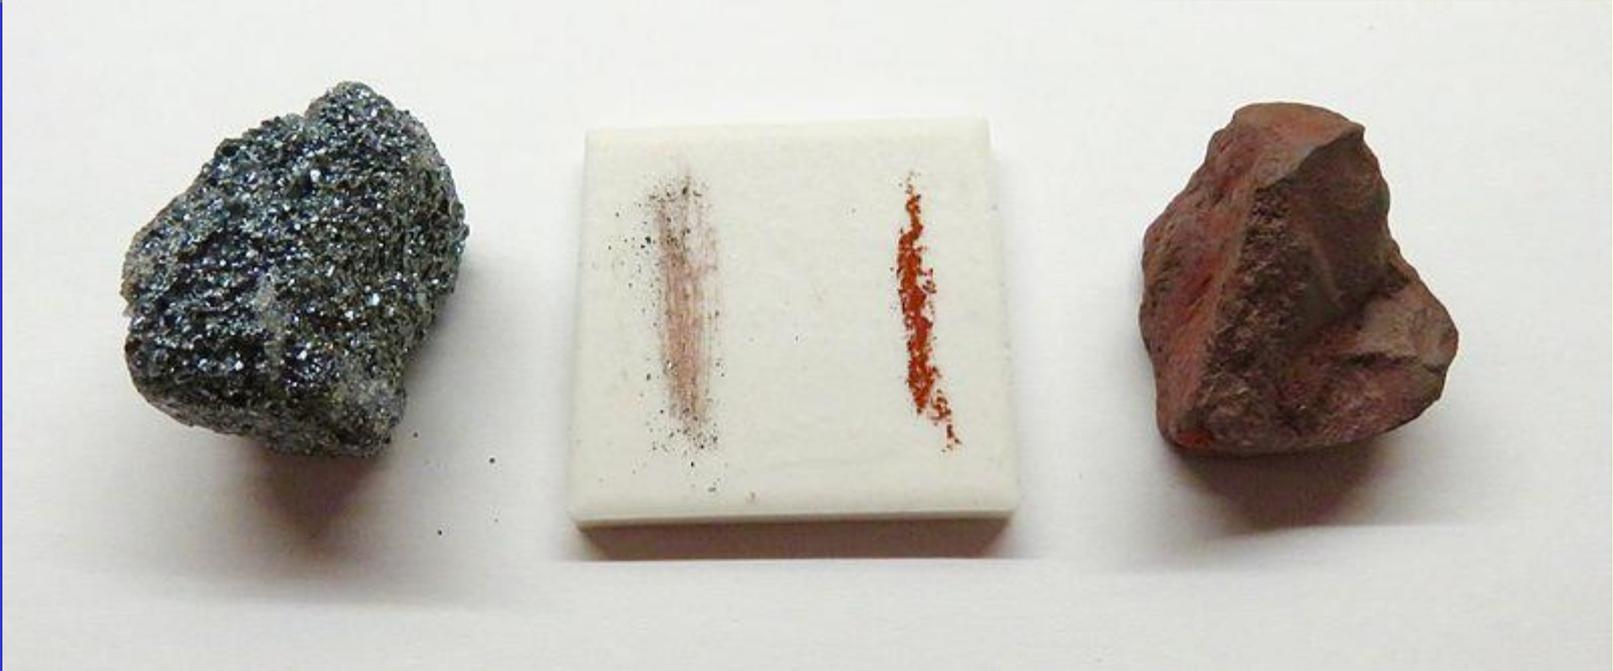

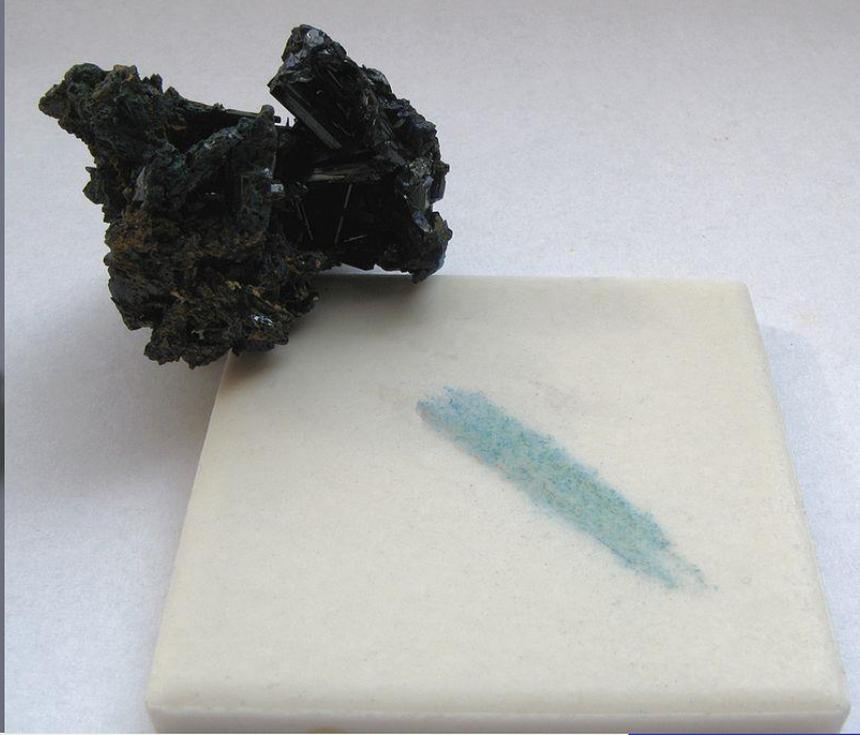

Malaquita

# COR DO TRAÇO

- É a cor do pó do mineral.
- Risca-se o mineral numa placa de porcelana.
- Útil para identificação de minerais de brilho metálico, visto que em inúmeros casos a cor do pó é bem distinta da cor exibida pelo mineral.
- Minerais translúcidos e transparentes exibem traço branco.
- Porcelana tem dureza 6 a 7. Minerais com dureza > que 7, o traço resultante não é do mineral, mas sim da porcelana.

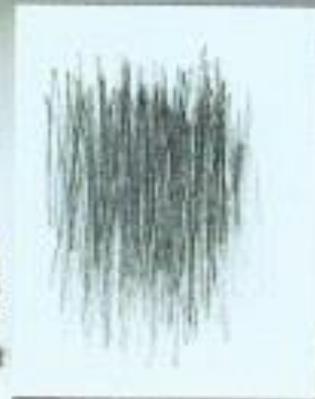

The red-brown streak of the mineral hematite.

**Cinnabar**

**Pyrite**

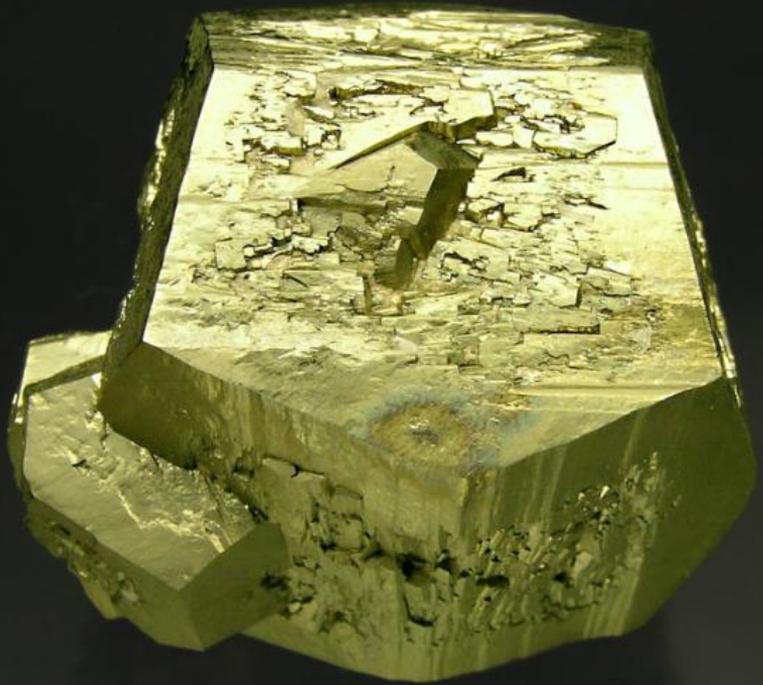

# BRILHO

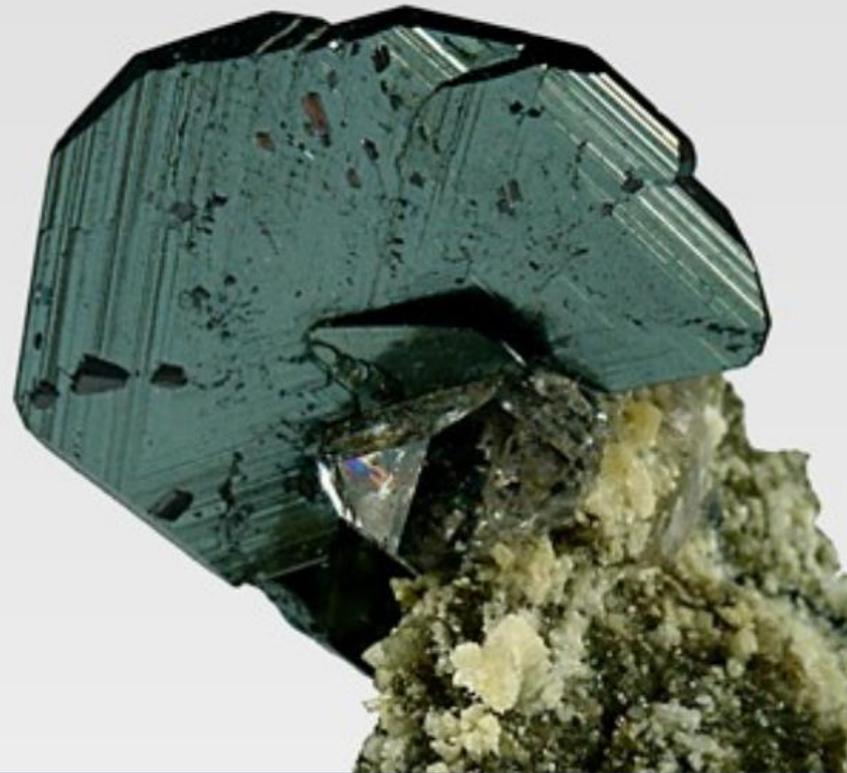

- Qualidade e intensidade de luz refletida de um mineral
- Tipos:
  - Metálico
  - Não metálico: vítreo, resinoso, adamantino, perláceo, sedoso, gorduroso
  - Quando a superfície não tem brilho, diz-se que é fosca.

Galena  $\text{PbS}$  ,  
Quartz  $\text{SiO}_2$  ,  
Calcite  $\text{CaCO}_3$

Pirita  $\text{FeS}_2$

Hematita  $\text{Fe}_2\text{O}_3$

Metallic Luster - Pyrite

Nonmetallic Luster - Kaolinite

Metallic Luster

Nonmetallic Luster

# Transparência: passagem da luz

- *Minerais transparentes*: não absorvem ou absorvem pouco a luz
- *Minerais translúcidos*: absorvem a luz consideravelmente e dificultam o reconhecimento das imagens através deles
- *Minerais opacos*: absorvem toda a luz – elementos nativos metálicos, óxidos e sulfetos

# DUREZA

- resistência ao ser riscado.

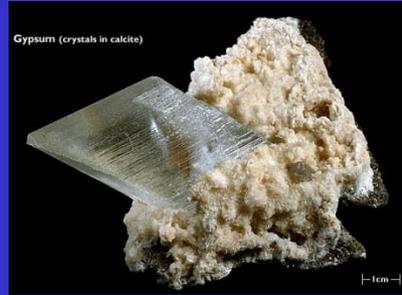

# Escala de Mohs

1 – Talco	$\text{Mg}_3\text{Si}_4\text{O}_{10}(\text{OH})_2$	Palito de fósforo (~1,1)
2 – Gipsita	$\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$	Unha (~ 2)
3 – Calcita	$\text{CaCO}_3$	Alfinete (~3,5)
4 – Fluorita	$\text{CaF}_2$	
5 – Apatita	$\text{Ca}_5(\text{PO}_4)_3(\text{F},\text{Cl},\text{OH})$	Aço – lâmina de barbear (~ 5)
6 – Feldspato potássico	$\text{K}(\text{AlSi}_3\text{O}_8)$	Vidro (~ 5,5)
7 – Quartzo	$\text{SiO}_2$	Porcelana (~ 6,0)
8 – Topázio	$\text{Al}_2\text{SiO}_4(\text{F},\text{OH})_2$	
9 – Coríndon	$\text{Al}_2\text{O}_3$	
10 - Diamante	C

# DUREZA

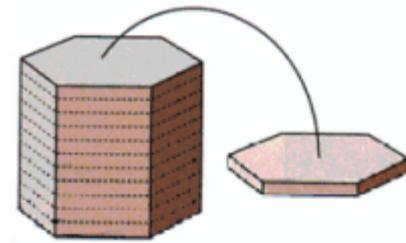

- Refere-se à resistência relativa de um mineral ao ser riscado
- Escala de dureza relativa de Mohs (não representa intervalos iguais de dureza)

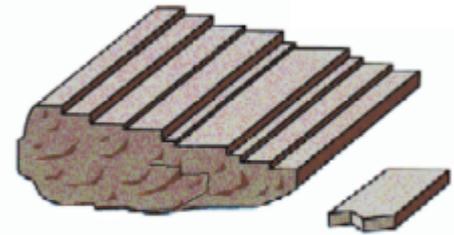

# CLIVAGEM

- Tendência de um mineral a se quebrar em superfícies planas

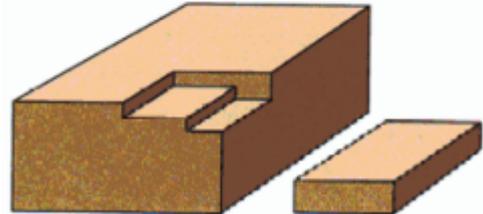

*One direction - basal*

*Two directions - prismatic*

*Three directions - cubic*

## **Types of Cleavage**

Fluorite

Halite

Calcite

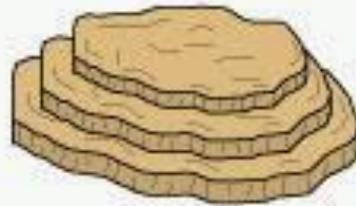

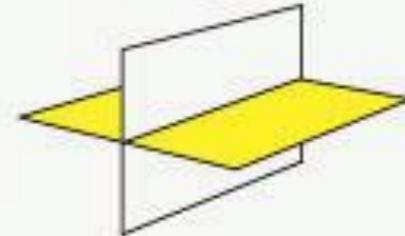

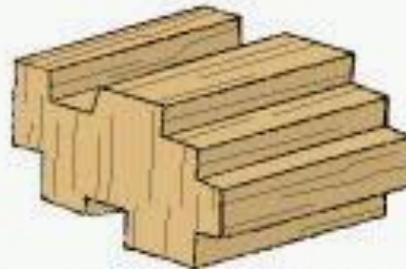

# Muscovita

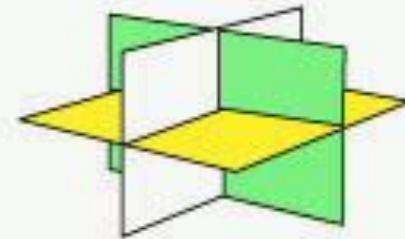

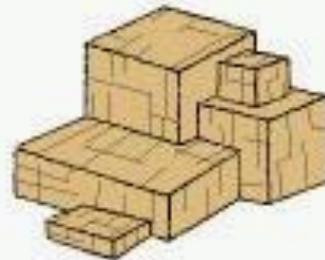

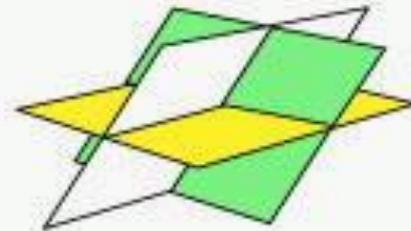

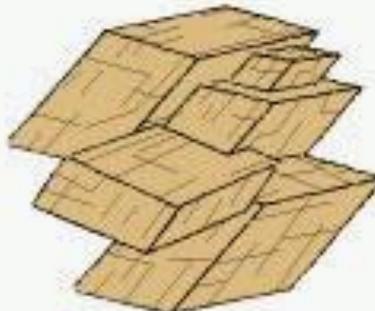

**Cleavage in one direction. Example: MUSCOVITE**

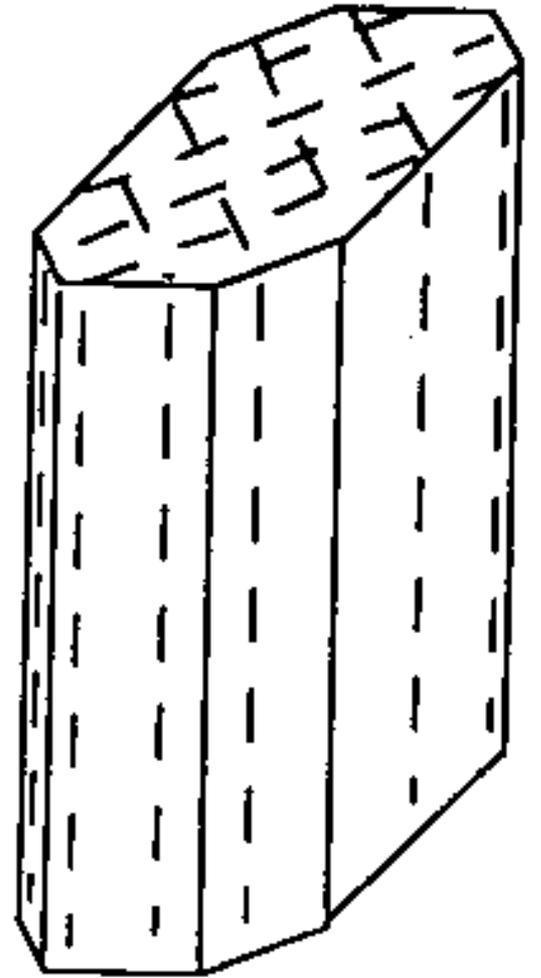

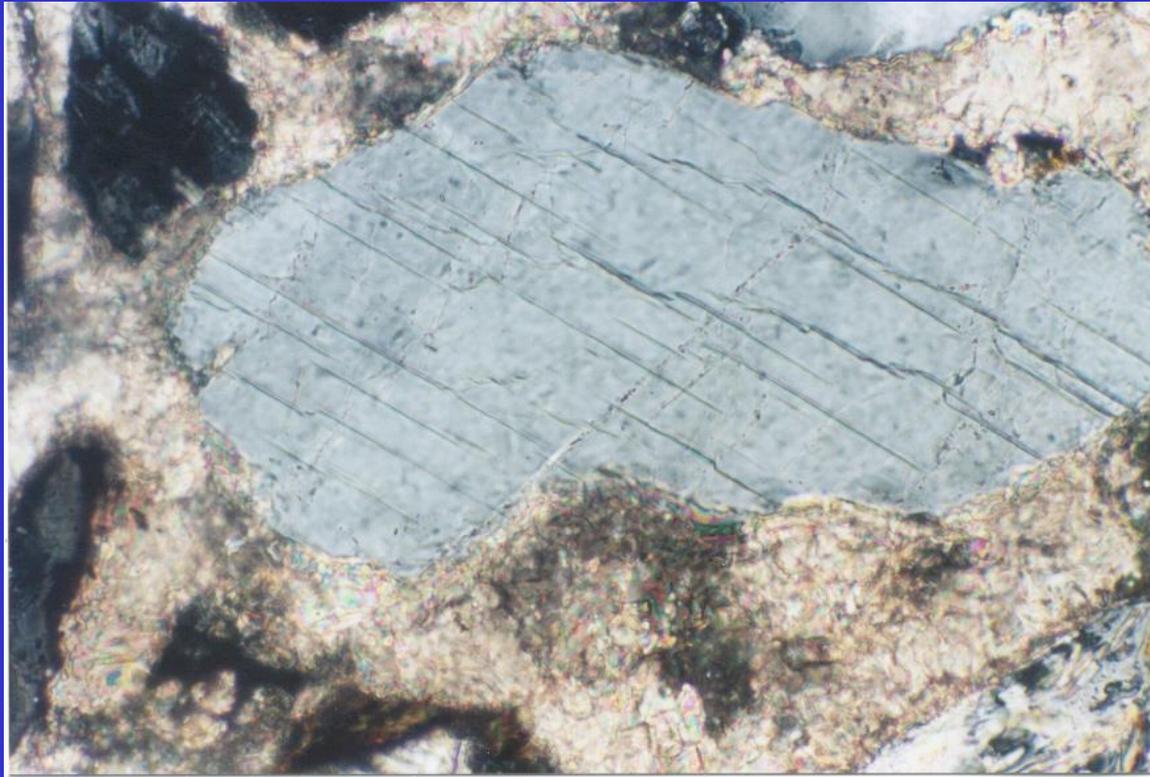

**Cleavage in two directions. Example: FELDSPAR**

**Cleavage in three directions. Example: HALITE**

**Cleavage in two directions. Example: CALCITE**

# FRATURA

- quebra dos minerais em superfícies não planas.
- - fratura conchoidal.

- Hábito
- Equidimensional
  - Prismático
    - Acicular
    - Tabular
    - Placóide
    - Terroso
  - Botrioidal
    - Fibroso

**Galena Cubes**

**Pyrite Pyritohedrons**

**Hexagonal Beryl**

**Calcite Scalenohedrons**

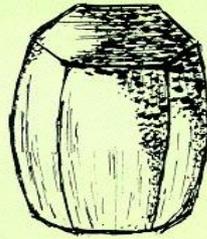

**Tabular Wulfenite**

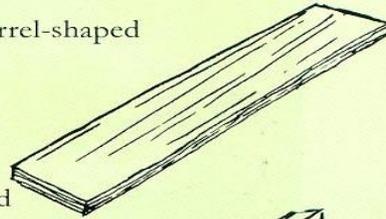

**Prismatic Stibnite**

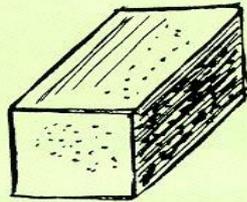

# Growth Habits of Single Crystals

# Dendritos de Óxido de Manganês

# The "Acid" Test

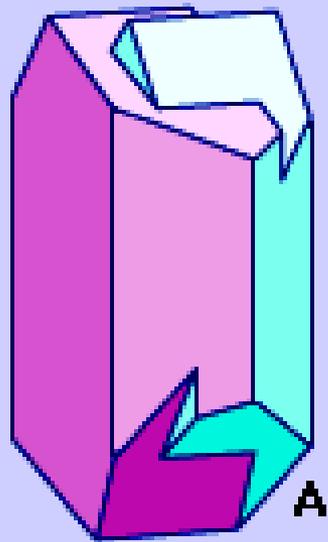

# DENSIDADE RELATIVA

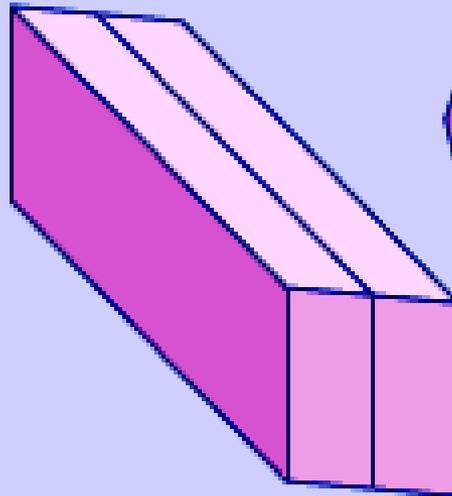

- Indica quantas vezes certo volume do mineral é mais pesado que o mesmo volume de água destilada, à temperatura de 4°C.
- Minerais formadores de rocha têm densidade entre 2,5 a 3,3.
- Minerais com elementos de alto peso atômico (Ba, Pb, Sr...) têm densidade > que 4.

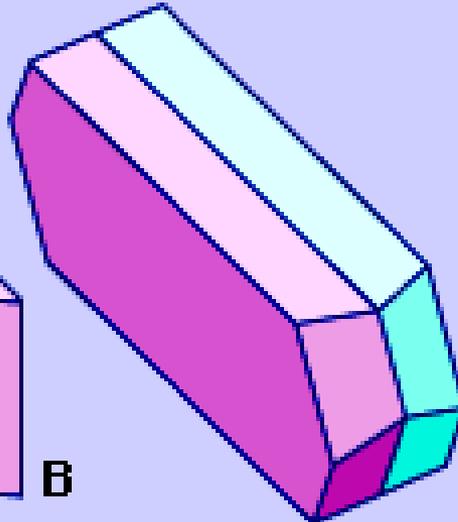

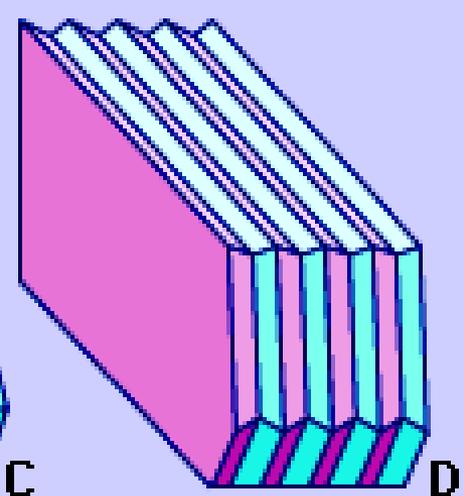

A

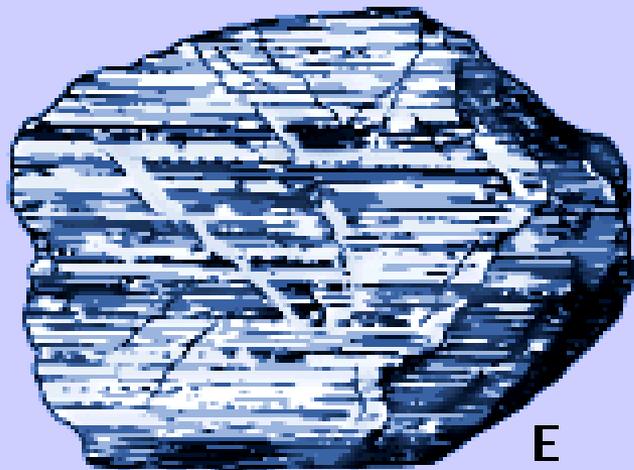

B

C

D

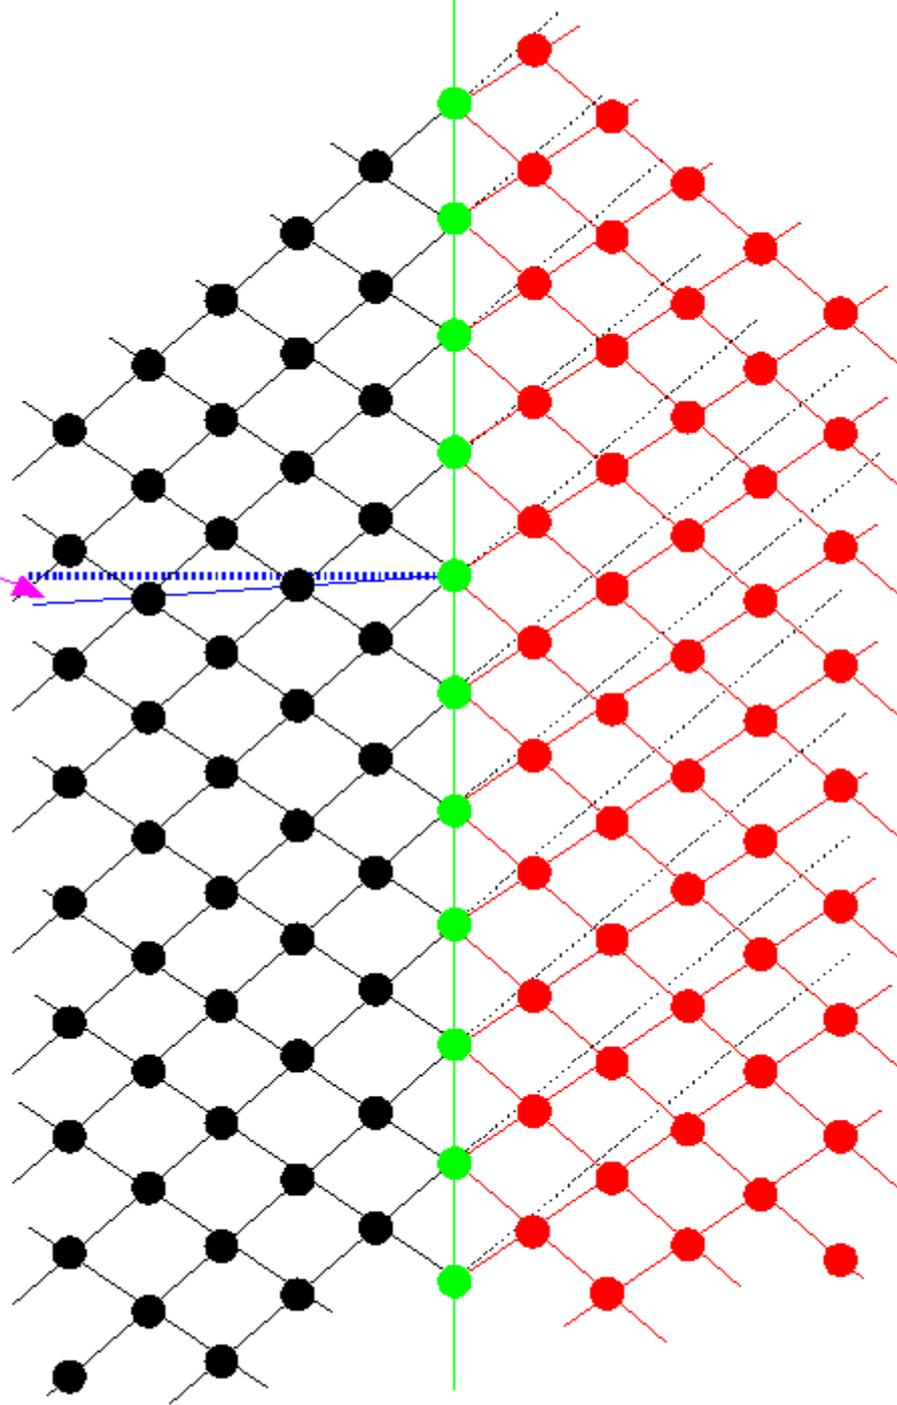

E

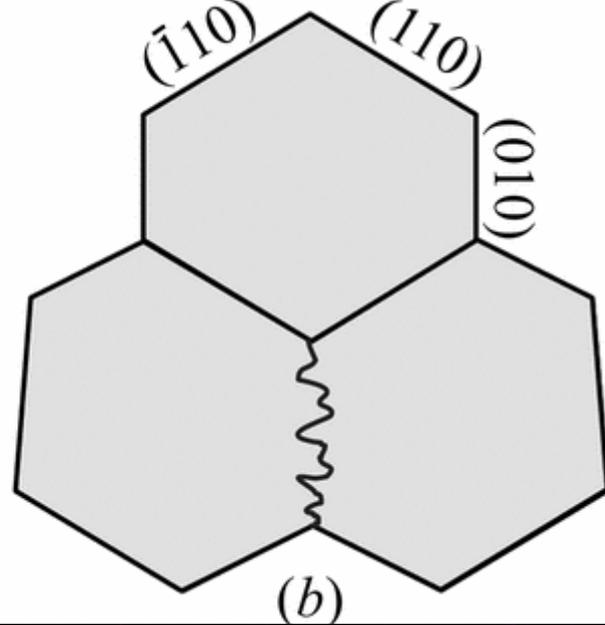

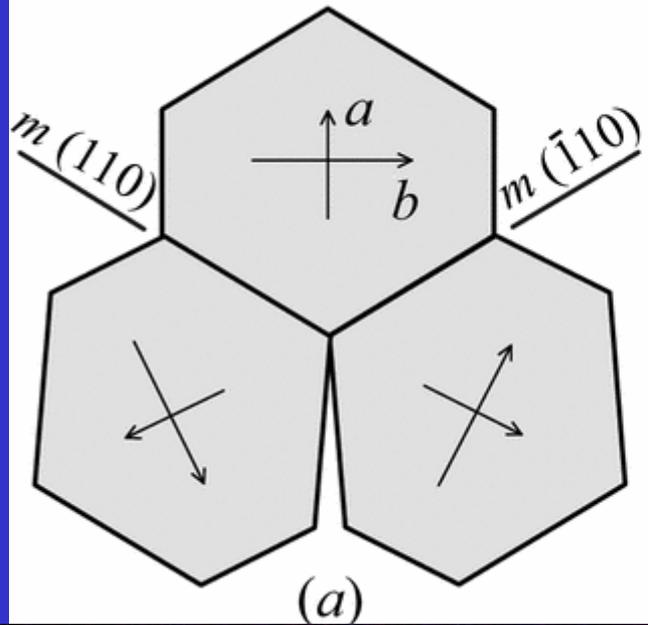

- (A) Carlsbad twinning
- (B) untwinned crystal
- (C) single Albite twin
- (D) multiple Albite twins
- (E) Albite twinning as it appears on a cleavage surface of a plagioclase specimen

# Geminação

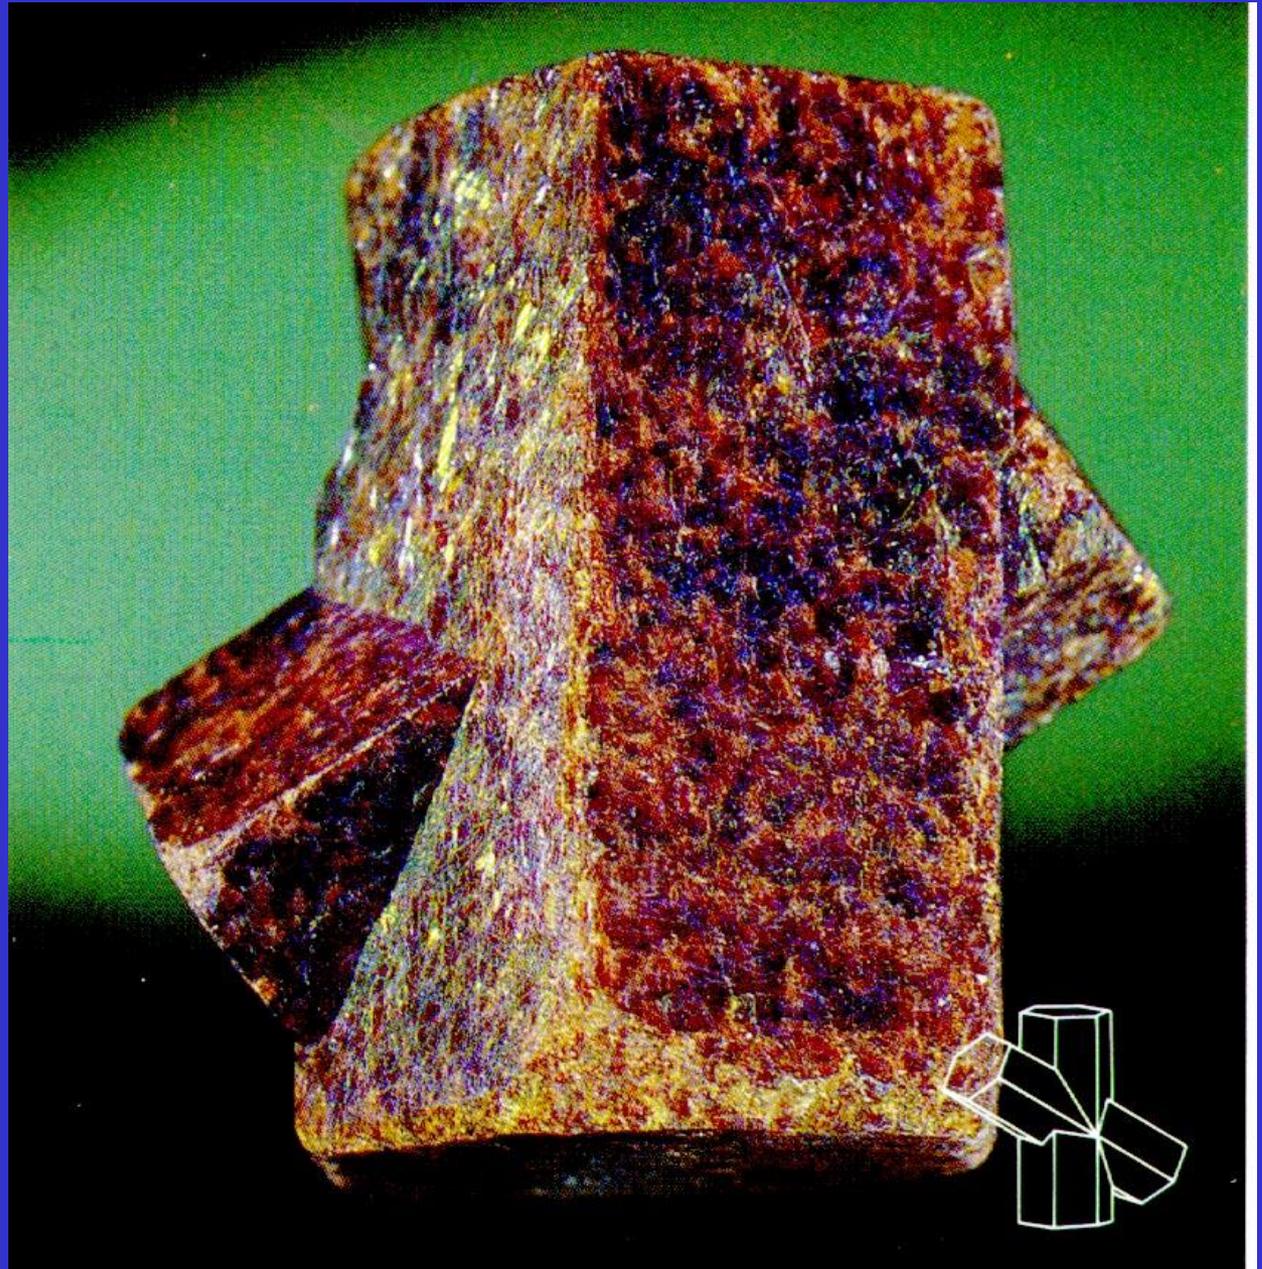

- Intercrescimento mineral de maneira regular
- Pode ser uma propriedade diagnóstica do mineral

$\omega$

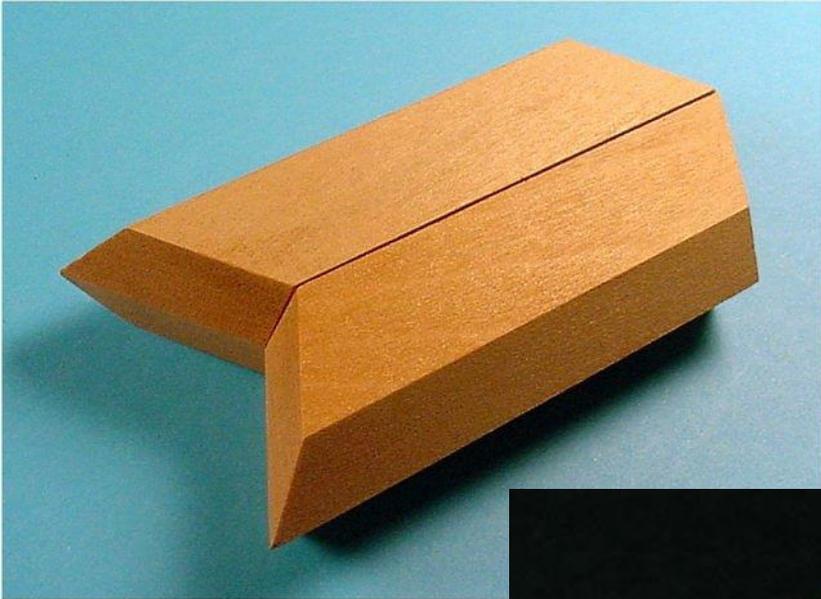

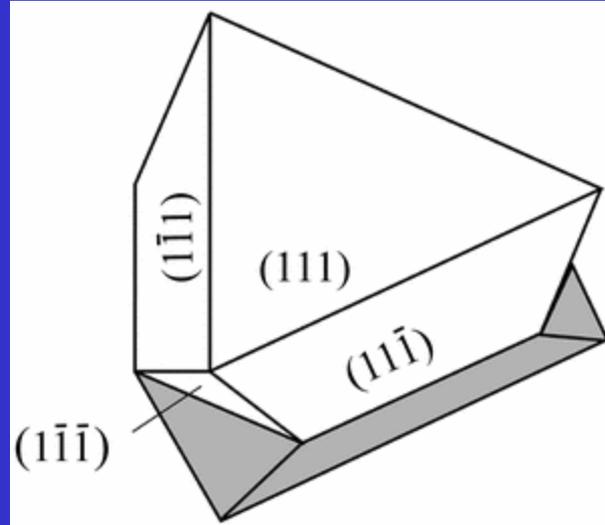

Estauroлита

(b)

(c)

# PROPIEDADES ORGANOLÉPTICAS

- TATO
- ODOR
  - Ex: fétido
- SABOR
  - Ex: salino

# Halita

**Fisionomia após lamber**

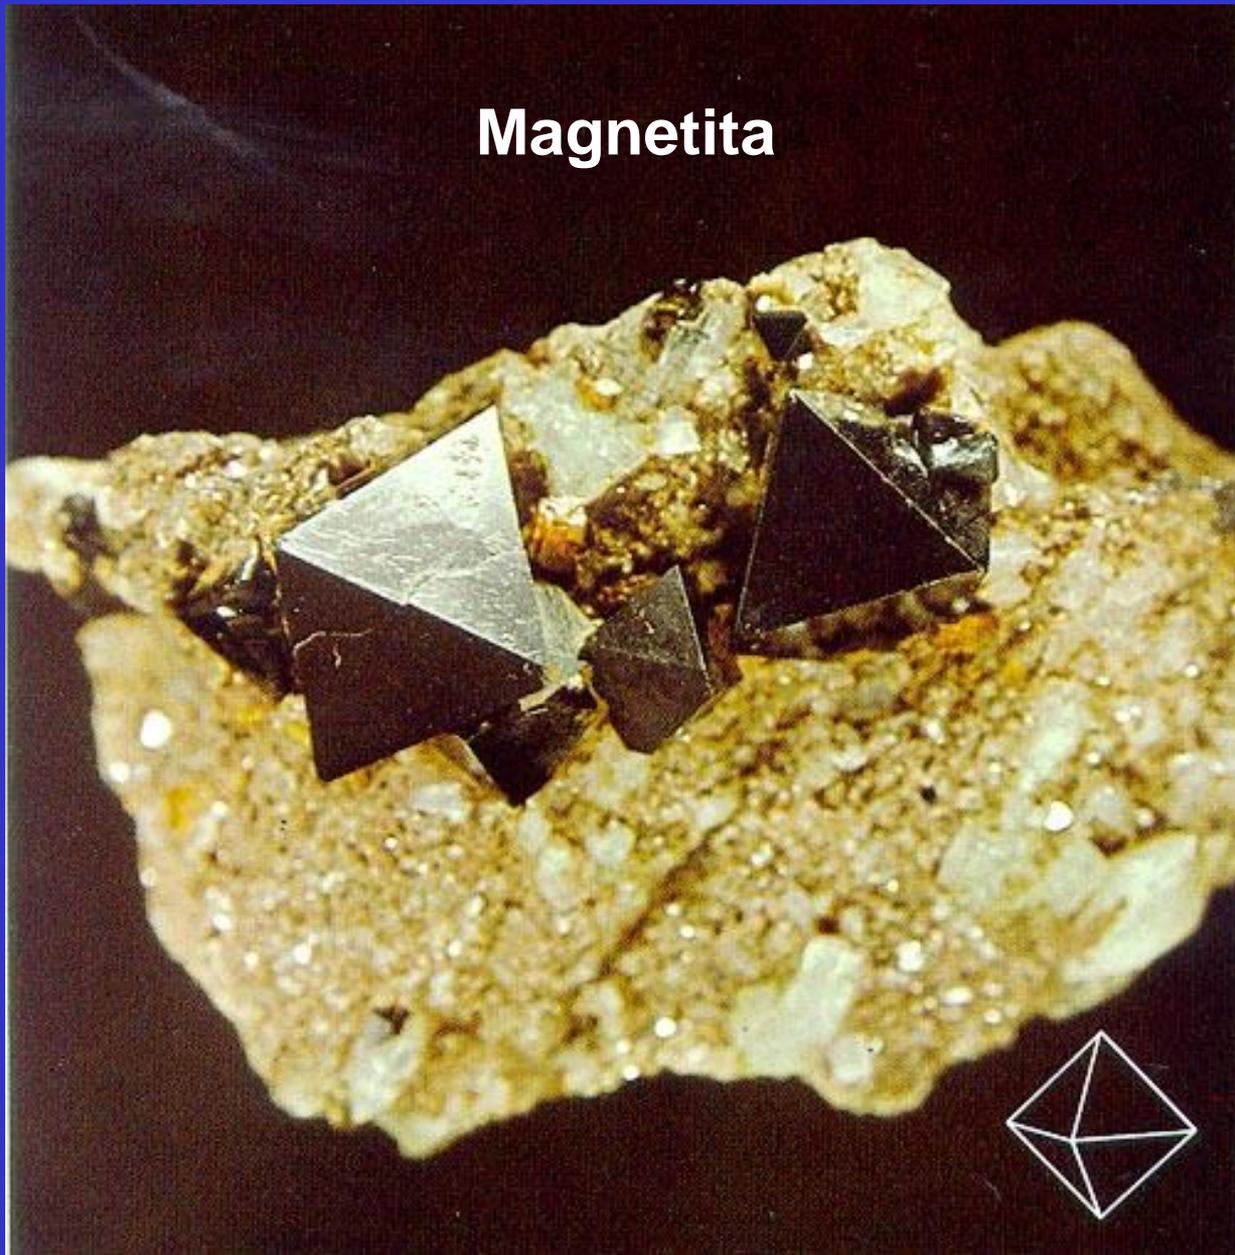

**a primeira rocha argilosa...**

# PROPRIEDADES MAGNÉTICAS

- Minerais que são atraídos por um ímã de mão:
  - magnetita ( $\text{Fe}_3\text{O}_4$ )
  - pirrotita ( $\text{Fe}_{<1}\text{S}$ )

# Magnetita
