

Antibiotics

What are antibiotics?

Who are the main producers?

Biological functions?

Resistance

New developments

First antimicrobial approaches

Louis Pasteur (1822-1895):

“pasteurization”

Fermentation: wine
contamination

Germ theory: silkworm disease

Vaccine: anthrax, fowl cholera

Rabies

First antimicrobial drugs

Paul Ehrlich (1854-1915):

- Methylene blue: malaria
- Toxin and antitoxin
- Salvarsan: magic bullet
against syphilis, *Treponema pallidum*

First antimicrobial drugs

- Gerhard Domagk (Nobel Prize 1939)

Sulfa drugs

Prontosil

Sulfanilamide, analog of p-aminobenzoic acid
(part of folic acid, precursor of nucleic acids)

Development of antituberculosis compounds
thiosemicarbasone and isoniazid

Penicillium colony

Area of inhibition of bacterial growth

1928 Alexander Fleming

1940 Howard Florey
Ernst Chain

1954 Cephalosporin C

Normal bacterial colony

Staphylococcus aureus

Primary and secondary metabolism

What are antibiotics?

- Secondary metabolites synthesized by some microorganisms

Who are the main producers

- Bacteria

Gram positive *Streptomyces*

- Fungi
- Other bacteria

TABLE 20.1**Representative Sources
of Antibiotics**

Microorganism	Antibiotic
Gram-Positive Rods	
<i>Bacillus subtilis</i>	Bacitracin
<i>Paenibacillus polymyxa</i>	Polymyxin
Actinomycetes	
<i>Streptomyces nodosus</i>	Amphotericin B
<i>Streptomyces venezuelae</i>	Chloramphenicol
<i>Streptomyces aureofaciens</i>	Chlortetracycline and tetracycline
<i>Saccharopolyspora erythraea</i>	Erythromycin
<i>Streptomyces fradiae</i>	Neomycin
<i>Streptomyces griseus</i>	Streptomycin
<i>Micromonospora purpurea</i>	Gentamicin
Fungi	
<i>Cephalosporium</i> spp.	Cephalothin
<i>Penicillium griseofulvum</i>	Griseofulvin
<i>Penicillium chrysogenum</i>	Penicillin

MICROORGANISMS and BIOACTIVE COMPOUNDS

Antitumorals

Antifungals

Bioactives

BIOACTIVE COMPOUNDS SYNTHESIZED BY ACTINOBACTERIA

ANTIBACTERIALS

Erythromycin
Tetracycline
Gentamicin

ANTIFUNGALS

Amphotericin B
Nystatin

ANTIPARASITICS

Avermectins

ANTITUMORALS

Doxorubicin
Mitramycin
Bleomycin

IMUNOSUPPRESSANTS

Rapamycin
FK506

INSETICIDES

Espinosin

HERBICIDES

Bialaphos

LIFE CYCLE OF *Streptomyces*

Production of secondary metabolites
(antibiotics, fungicides, antitumorals,..)

Biological functions of antibiotics?

- In the producer:
Activators of morphological differentiation, UV protector, communication
- In the target microorganism:
Toxicity

Figure 20-9a Brock Biology of Microorganisms 11/e

Antibiotic classification

I. Carbohydrate-containing compounds

Subclassification

Pure sugars
Aminoglycosides
Orthosomycins
N-Glycosides
C-Glycosides
Glycolipids

Example

Nojirimycin
Streptomycin
Everninomicin
Streptothricin
Vancomycin
Moenomycin

II. Macrocyclic lactones

Macrolide antibiotics
Polyene antibiotics
Ansamycins
Macrotetrolides

Erythromycin
Candididin
Rifampin
Tetranactin

III. Quinones and related compounds

Tetracyclines
Anthracyclines
Naphthoquinones
Benzoquinones

Tetracycline
Adriamycin
Actinorhodin
Mitomycin

Representative structure

Figure 20-13 part 1 Brock Biology of Microorganisms 11/e

Antibiotic classification

IV. Amino acid and peptide analogs

Subclassification

Amino acid derivatives
 β -Lactam antibiotics

Peptide antibiotics
Chromopeptides
Depsipeptides
Chelate-forming peptides

Example

Cycloserine
Penicillin,
ceftriaxone
Bacitracin
Actinomycin
Valinomycin
Bleomycin

Representative structure

V. Heterocyclic compounds containing nitrogen

Nucleoside antibiotics

Polyoxins

VI. Heterocyclic compounds containing oxygen

Polyether antibiotics

Monensin

Antibiotic classification

VII. Alicyclic derivatives

Subclassification

Cycloalkane derivatives
Steroid antibiotics

Example

Cycloheximide
Fusidic acid

VIII. Aromatic compounds

Benzene derivatives
Condensed aromatics
Aromatic ether

Chloramphenicol
Griseofulvin
Novobiocin

IX. Aliphatic compounds

Compounds containing phosphorus

Fosfomycin

Representative structure

Antibiotic classification

Subclassification

Example

X. Quinolone compounds

4-Quinolone
Fluoro-4-quinolones

Nalidixic acid
Ciprofloxacin

XI. Oxazolidinone

Cyclic lactone

2-Oxazolidinone

Representative structure

Fosfomycin

2-Oxazolidinone

Nalidixic acid

TABLE 20.3**Antibacterial Drugs**

Drugs by Mode of Action	Comments
Inhibitors of Cell Wall Synthesis	
Natural Penicillins	
Penicillin G	Against gram-positive bacteria, requires injection
Penicillin V	Against gram-positive bacteria, oral administration
Semisynthetic Penicillins	
Oxacillin	Resistant to penicillinase
Ampicillin	Broad spectrum
Amoxicillin	Broad spectrum; combined with inhibitor of penicillinase
Aztreonam	A monobactam; effective for gram-negative bacteria, including <i>Pseudomonas</i> spp.
Imipenem	A carbapenem; very broad spectrum
Cephalosporins	
Cephalothin	First-generation cephalosporin; activity similar to penicillin; requires injection
Cefixime	Third-generation cephalosporin; oral administration

TABLE 20.3

Antibacterial Drugs (continued)

Drugs by Mode of Action	Comments
Polypeptide Antibiotics	
Bacitracin	Against gram-positive bacteria; topical application
Vancomycin	A glycopeptide type; penicillinase-resistant; against gram-positive bacteria
Antimycobacterial Antibiotics	
Isoniazid	Inhibits synthesis of mycolic acid component of cell wall of <i>Mycobacterium</i> spp.
Ethambutol	Inhibits incorporation of mycolic acid into cell wall of <i>Mycobacterium</i> spp.
Inhibitors of Protein Synthesis	
Chloramphenicol	Broad spectrum, potentially toxic
Aminoglycosides	
Streptomycin	Broad spectrum, including mycobacteria
Neomycin	Topical use, broad spectrum
Gentamicin	Broad spectrum, including <i>Pseudomonas</i> spp.
Tetracyclines	
Tetracycline, oxytetracycline, chlortetracycline	Broad spectrum, including chlamydias and rickettsias; animal feed additives
Macrolides	
Erythromycin	Alternative to penicillin
Azithromycin, clarithromycin	Semisynthetic; broader spectrum and better tissue penetration than erythromycin
Telithromycin (Ketek)	New generation of semisynthetic macrolides; used to cope with resistance to other macrolides

TABLE 20.3

Antibacterial Drugs (continued)

Drugs by Mode of Action	Comments
Streptogramins	
Quinupristin and dalfopristin (Synercid)	Alternative for treating vancomycin-resistant gram-positive bacteria
Oxazolidinones	
Linezolid (Zyvox)	Useful primarily against penicillin-resistant gram-positive bacteria
Injury to the Plasma Membrane	
Polymyxin B	T opical use, gram-negative bacteria, including <i>Pseudomonas</i> spp.
Inhibitors of Nucleic Acid Synthesis	
Rifamycins	
Rifampin (or rifampicin)	Inhibits synthesis of mRNA; treatment of tuberculosis
Quinolones and Fluoroquinolones	
Nalidixic acid, norfloxacin, ciprofloxacin	Inhibit DNA synthesis; broad spectrum; urinary tract infections
Gatifloxacin	Newest generation quinolone; increased potency against gram-positive bacteria
Competitive Inhibitors of the Synthesis of Essential Metabolites	
Sulfonamides	
Trimethoprim-sulfamethoxazole	Broad spectrum; combination is widely used

(a) Natural penicillins

Penicillin G (Requires injection)

Narrow spectrum of microbial activity

Penicillin V (Can be taken orally)

(b) Semisynthetic penicillins

Oxacillin

Narrow spectrum, only gram-positives, but resistant to penicillinase

Ampicillin

Extended spectrum, many gram-negatives

Broad spectrum antibiotic

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

(a) Three-dimensional detail of the protein synthesis site showing the 30S and 50S subunit portions of the 70S prokaryotic ribosome.

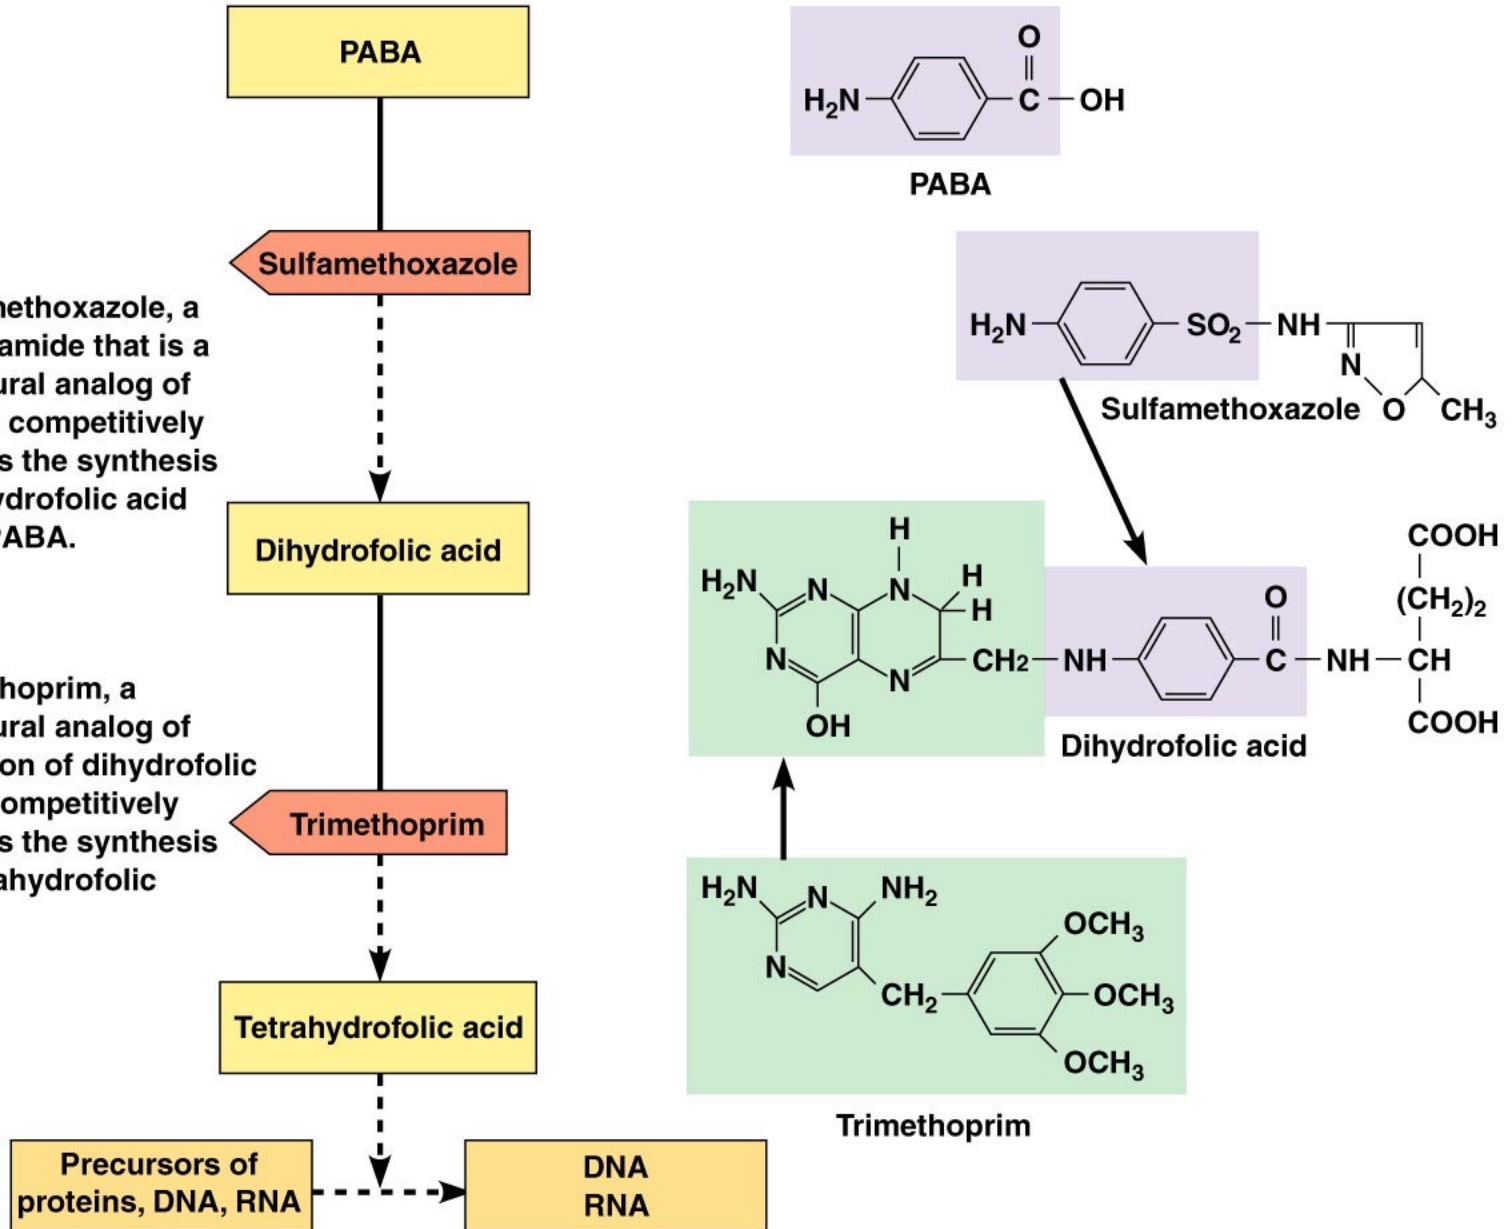

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

(b) In the diagram the black arrows indicate the different points at which chloramphenicol, the tetracyclines, and streptomycin exert their activities.

1 Sulfamethoxazole, a sulfonamide that is a structural analog of PABA, competitively inhibits the synthesis of dihydrofolic acid from PABA.

2 Trimethoprim, a structural analog of a portion of dihydrofolic acid, competitively inhibits the synthesis of tetrahydrofolic acid.

Membrane functions:
Polyenes bind to ergosterol and disrupt membrane integrity

Cell wall synthesis:
Polyoxins inhibit chitin synthesis
Echinocandins inhibit glucan synthesis

Ergosterol synthesis:
Azoles and Allylamines inhibit synthesis

Nucleic acid synthesis:
5-Fluorocytosine is a nucleotide analog that inhibits nucleic acid synthesis

Microtubule formation:
Griseofulvin disrupts microtubule aggregation during mitosis

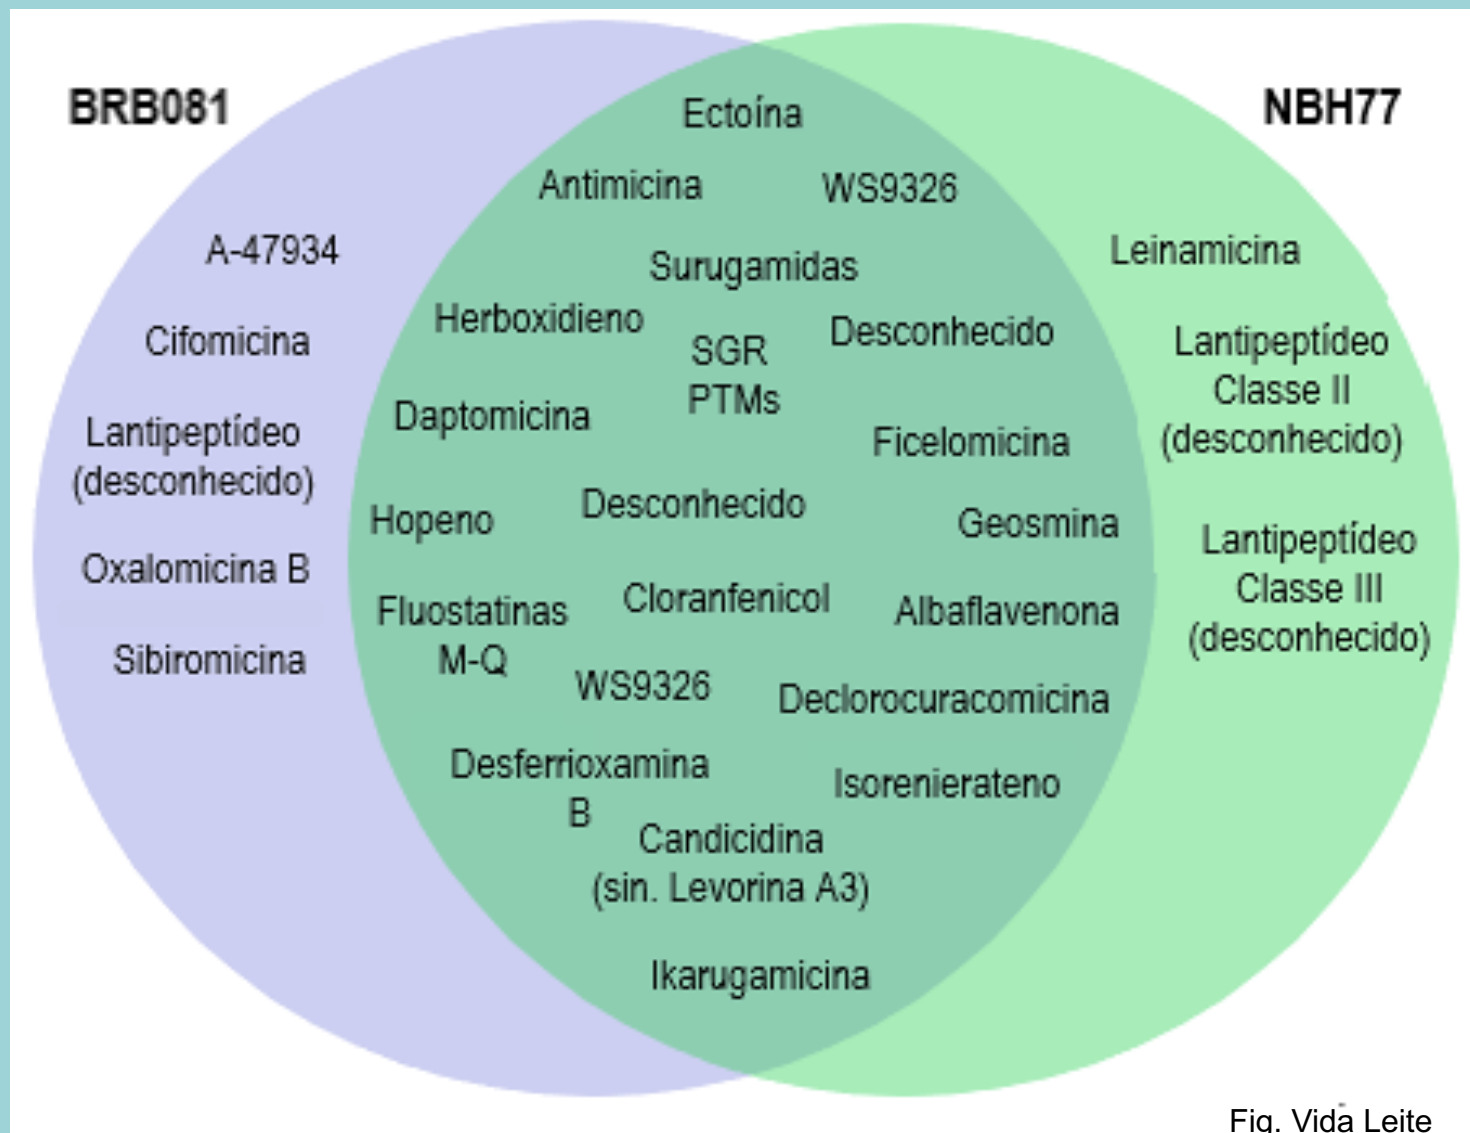

Fig. Vidã Leite

Comparação entre (A) BGC putativo de sibiromicina de BRB081 e (B) BGC de sibiromicina de *Streptosporangium sibiricum* (LI et al., 2009). Os limites de A foram definidos com base em homologia. As ORFs correlacionadas entre A e B são representadas pela mesma cor. As linhas pontilhadas conectam ORFs relacionadas e dispostas na mesma ordem.

Injury of plasma membrane of a yeast caused by antifungal drug

TABLE 20.4

Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs

	Mode of Action	Comments
Antifungal Drugs		
Agents Affecting Fungal Sterols (Plasma Membrane)		
Polyenes		
Amphotericin B	Injury to plasma membrane	Systemic fungal infections; fungicidal
Azoles		
Clotrimazole, miconazole	Inhibit synthesis of plasma membrane	Topical use
Ketoconazole	Inhibits synthesis of plasma membrane	Can be taken orally for systemic fungal infections
Voriconazole	Inhibits synthesis of plasma membrane	Can penetrate blood–brain barrier to treat aspergillosis of the central nervous system
Allylamines		
Terbinafine, naftifine	Inhibits synthesis of plasma membrane	New class of antifungals frequently used to treat diseases resistant to azoles
Agents Affecting Fungal Cell Walls		
Echinocandins		
Caspofungin (Cancidas)	New class of antifungals that inhibit synthesis of cell wall	

TABLE 20.4

Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs *(continued)*

	Mode of Action	Comments
Agents Inhibiting Nucleic Acids		
Flucytosine	Inhibits synthesis of RNA and therefore protein synthesis	
Other Antifungal Drugs		
Griseofulvin	Inhibition of mitotic microtubules	Fungal infections of the skin
Tolnaftate	Unknown	Athlete's foot
Antiviral Drugs (See also Table 20.5, Drugs for Chemotherapy of HIV)		
Nucleoside and Nucleotide Analogs		
Acyclovir, ganciclovir, ribavirin, lamivudine	Inhibit DNA or RNA synthesis	Used primarily against herpesviruses
Cidofovir	Inhibits DNA or RNA synthesis	Cytomegalovirus infections; possibly effective against smallpox
Adefovir dipivoxil (Hepsera)		For resistance against lamivudine
Attachment and Uncoating		
Zanamivir, oseltamivir	Inhibit neuraminidase on influenza virus	Treatment of influenza
Amantadine, zimantadine	Inhibit uncoating	Treatment of influenza
Interferons		
alpha-interferon	Inhibits spread of virus to new cells	Viral hepatitis

TABLE 20.4

Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs (continued)

	Mode of Action	Comments
Antiprotozoan Drugs		
Chloroquine	Inhibits DNA synthesis	Malaria; effective against red blood cell stage only
Diiodohydroxyquin	Unknown	Amoebic infections; amoebicidal
Metronidazole, Tinidazole	Interferes with anaerobic metabolisms	Giardiasis, amebiasis, trichomoniasis
Nitazoxanide	Interferes with anaerobic metabolism	Giardiasis; only drug approved for cryptosporidiosis
Anthelmintic Drugs		
Niclosamide	Prevents ATP generation in mitochondria	Tapeworm infections; kills tapeworms
Praziquantel	Alters permeability of plasma membranes	Tapeworm and fluke infections; kills flatworms
Pyantel pamoate	Neuromuscular block	Intestinal roundworms; kills roundworms
Mebendazole, albendazole	Inhibit absorption of nutrients	Intestinal roundworms
Ivermectin	Paralyzes worm	Intestinal roundworms primarily; occasional use for scabies mite and lice

Guanine

Deoxyguanosine

Acyclovir

(a) Acyclovir structurally resembles the nucleoside deoxyguanosine.

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

(b) The enzyme thymidine kinase combines phosphates with nucleosides to form nucleotides, which are then incorporated into DNA.

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

(c) Acyclovir has no effect on a cell not infected by a virus, that is, with normal thymidine kinase. In a virally infected cell, the thymidine kinase is altered and converts the acyclovir (which resembles the nucleoside deoxyguanosine) into a false nucleotide—which blocks DNA synthesis by DNA polymerase.
