Industrial Microbiology & Bioeconomy

Until the year 2000, all the microorganisms that were studied needed to be cultivated first...

Total vs. cultivatable microbial diversity

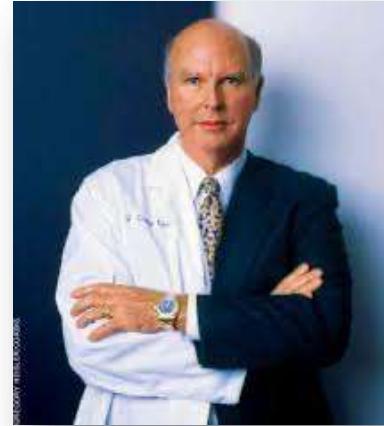

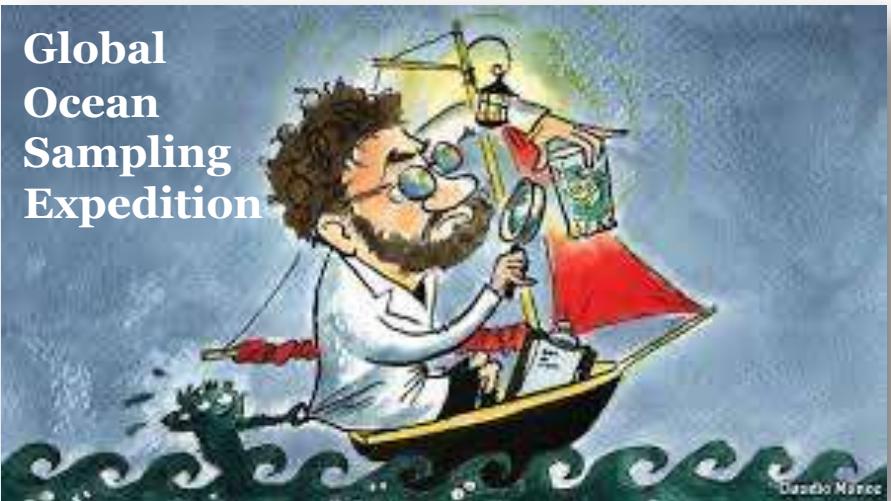

soil

viable cell counts after
cultivation

cultivation based methods find less than 3% of the bacterial and archaeal species in a sample

Craig Venter

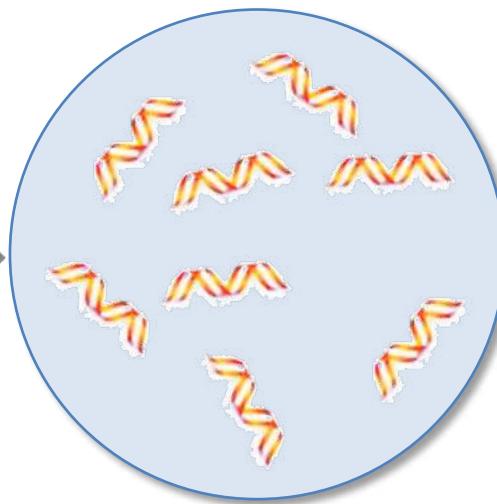

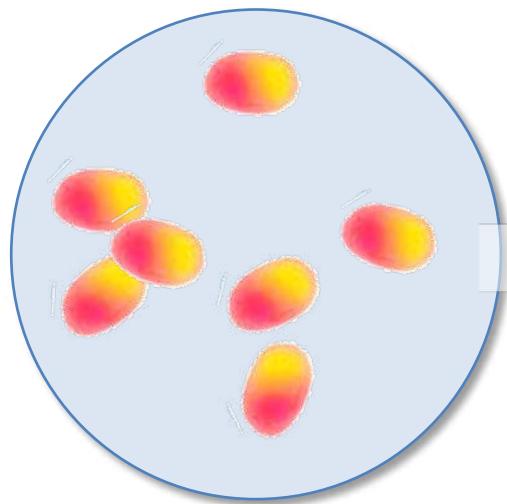

Metagenomics allows to sequence new organisms
that can not be cultivated in the lab

- 1.2 milhões de genes previamente desconhecidos
- 148 linhagens bacterianas inéditas

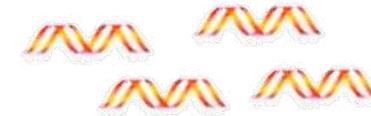

Venter et. al., 2004. Science

Metagenomic is analogous to genomic

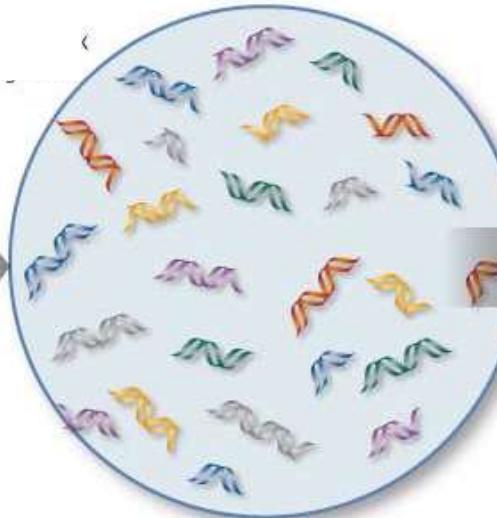

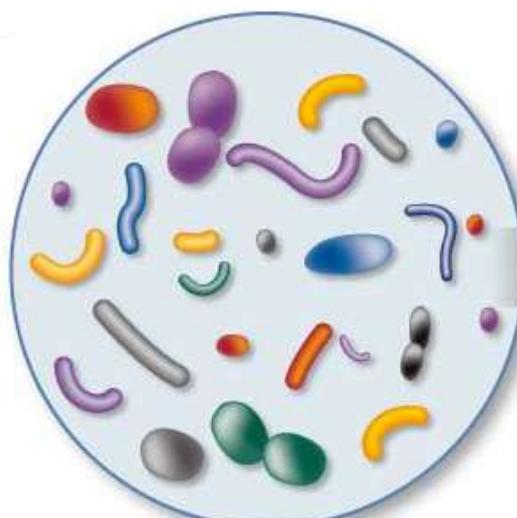

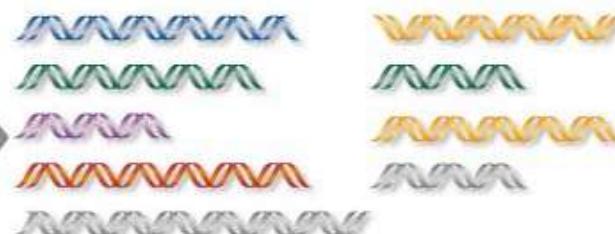

But the genome is not from a single microbe, but from an entire community

Genomics

Metagenomics

At present we do not know the extension of the functional diversity that microbes have

Microbial abundance

- **10⁶ microbial species (OTUs*) estimated worldwide**
- ~10.000 microbial species documented

Microbial total numbers

- $6 \times 10^7 - 4.8 \times 10^9$ cells per ml or gram
- **6×10^{30} prokaryotes** are estimated worldwide
- ~150.000 documented microorganisms

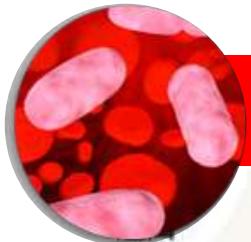

$10^{22} - 10^{24}$ stars in the Universe

*operational taxonomic units (OTUs, 16S-V4 gene clusters at 97% similarity)

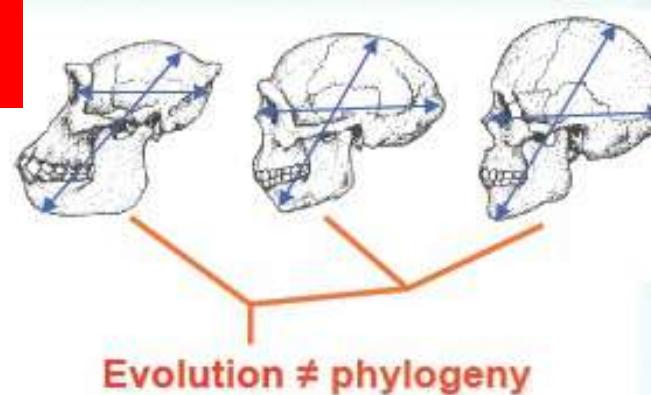

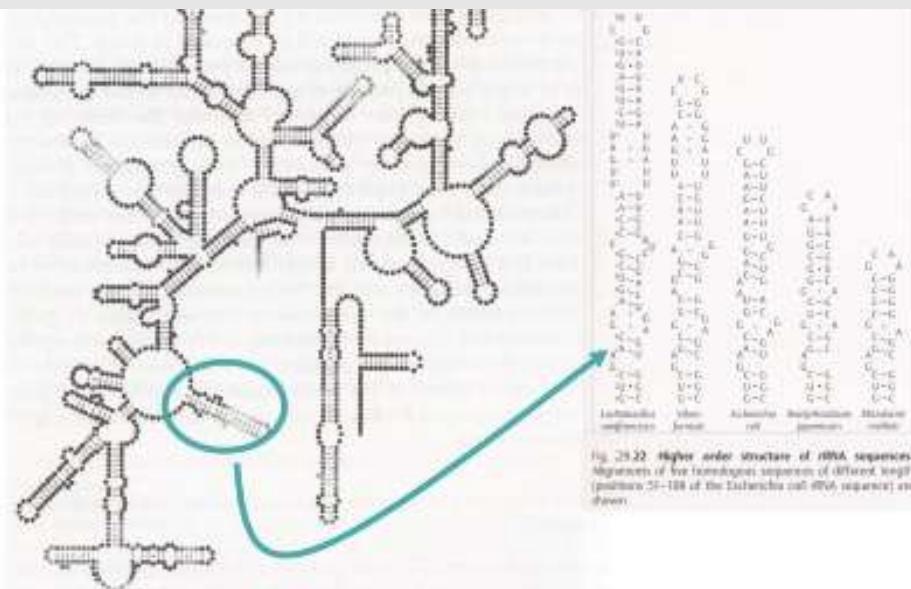

**...Como se estuda a diversidade dos
microrganismos?**

Phylogeny in bacteria

- ✓ **Evolution** ► mutations (morphometrics)
► **AGE (fossil record)**
 - ✓ **Phylogeny in PROKARYOTES** ► we know only the tips of the tree, nothing is said about putative ancestors
 - ✓ **PROKARYOTES** ► no fossil record ► molecular clocks

Molecular clocks (housekeeping genes):

16S rRNA, 23S rRNA, ATPases, TU-elongation factor, gyrases

Molecular clocks

The 16S rRNA gene:

- ✓ Universally represented
- ✓ Conserved
- ✓ No protein coding
- ✓ Base pairing (helix)
- ✓ Proper size

Carl Woese (1977)

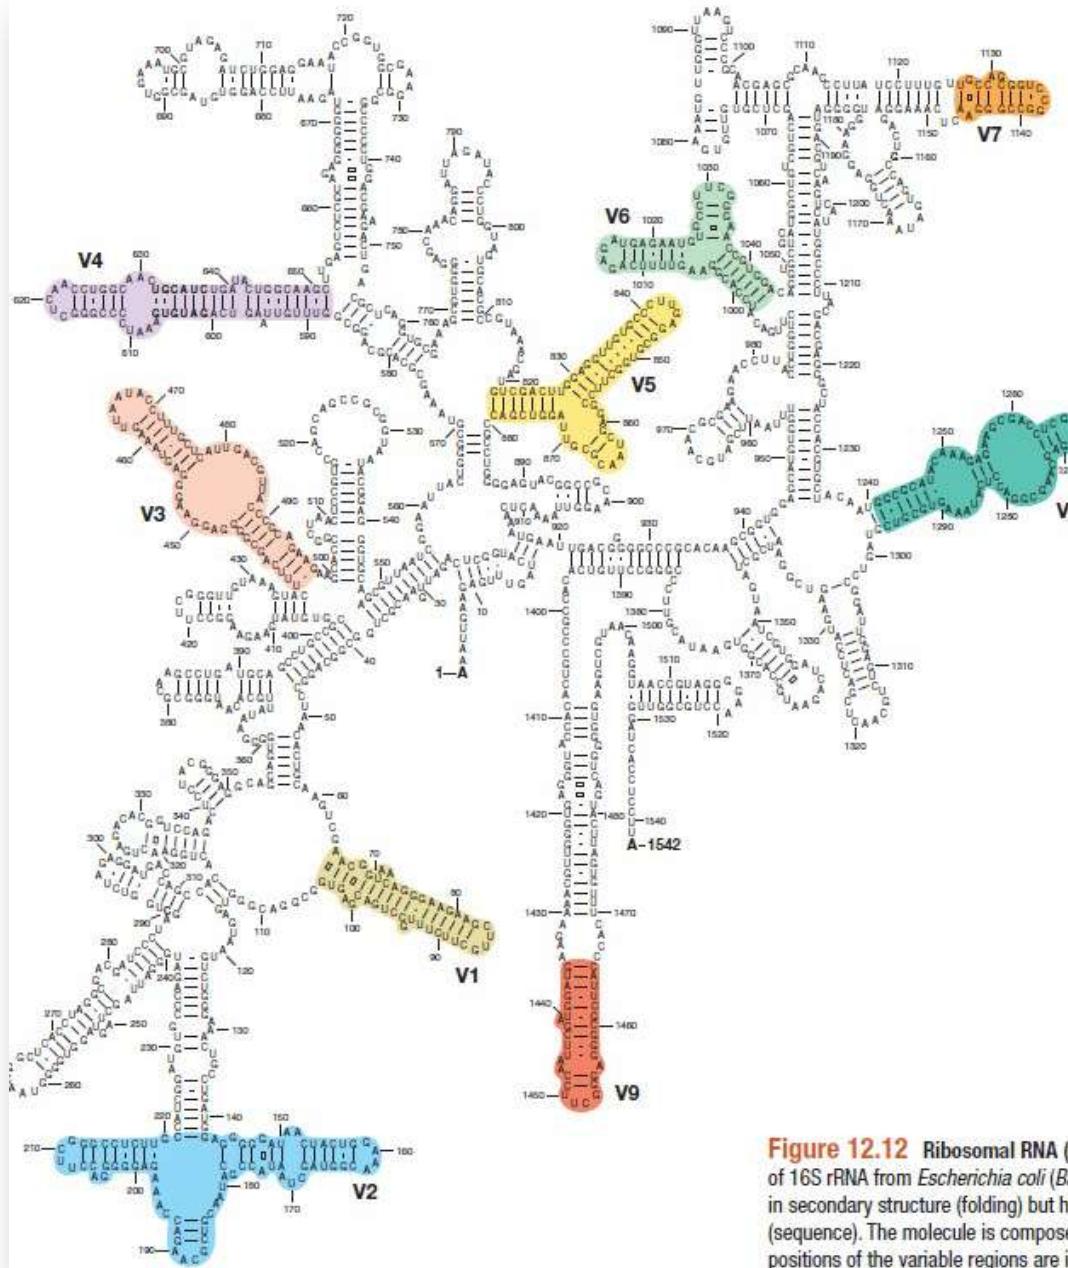

Figure 12.12 Ribosomal RNA (rRNA). Primary and secondary structure of 16S rRNA from *Escherichia coli* (Bacteria). The 16S rRNA from Archaea is similar in secondary structure (folding) but has numerous differences in primary structure (sequence). The molecule is composed of conserved and variable regions. The positions of the variable regions are indicated in color.

Phylogeny based in rRNA gene: the three domains of the life

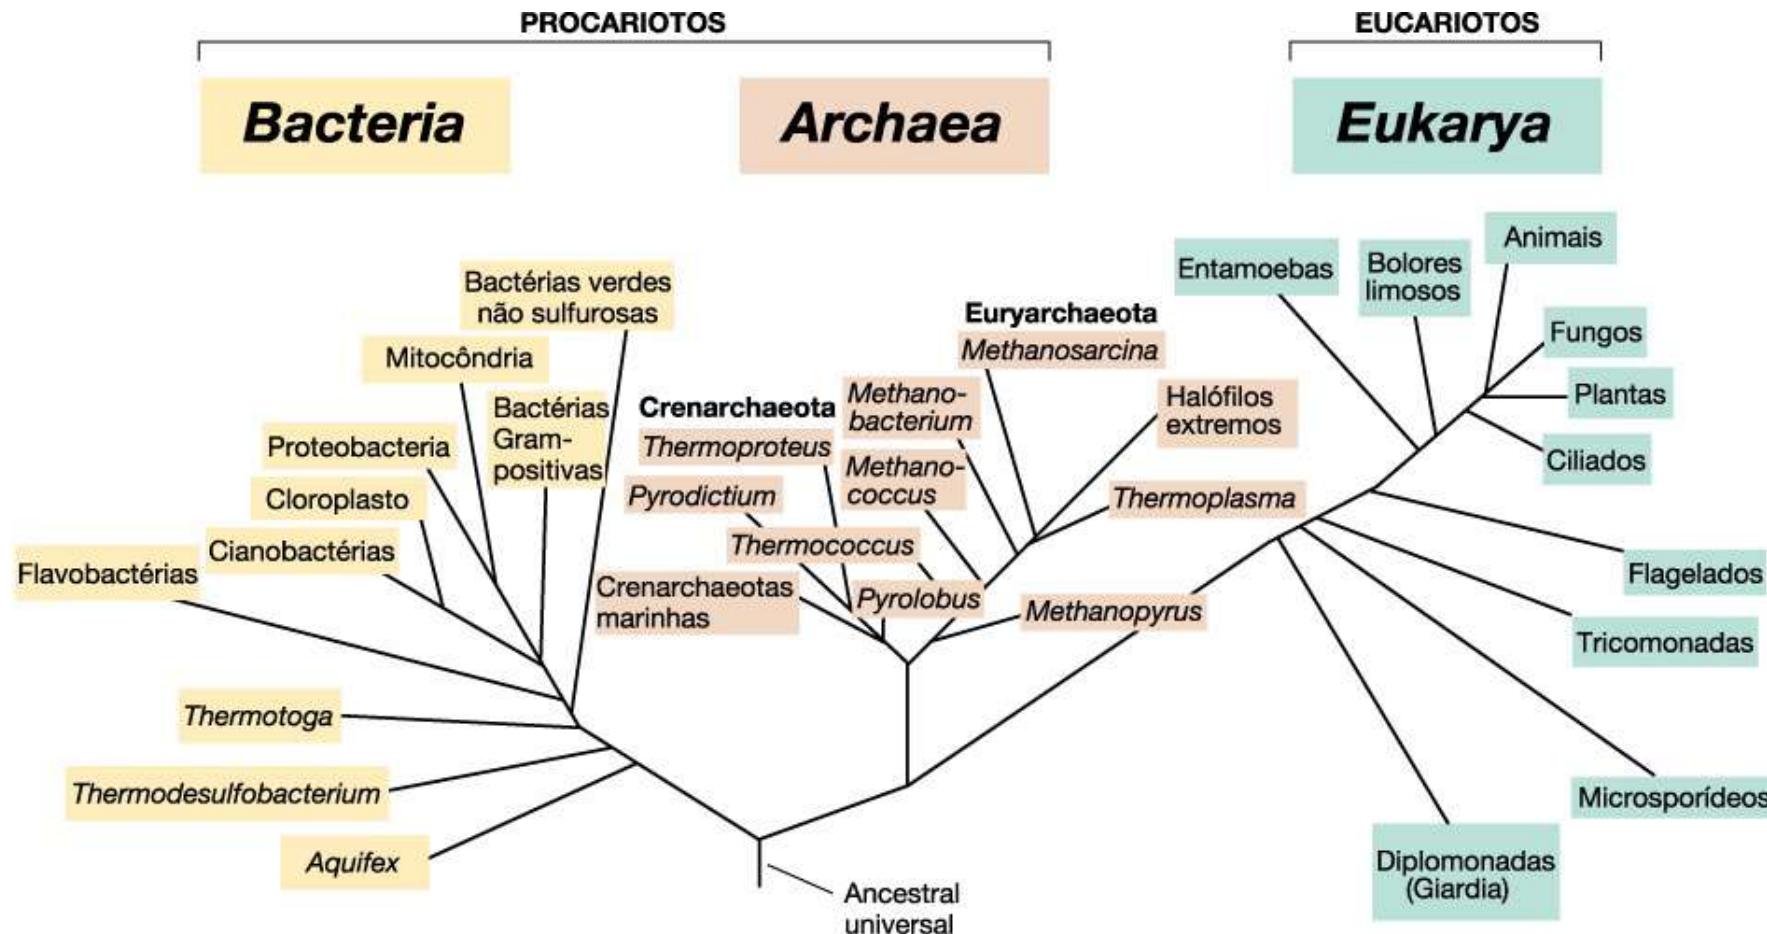

Figura 14.16 Árvore filogenética universal, determinada pela análise comparativa de sequências do gene de rRNA. São apresentados apenas alguns dos principais organismos ou linhagens de cada domínio. Dos três domínios, dois (Bacteria e Archaea) contêm apenas organismos desprovidos de núcleo envolto por membrana (células procarióticas, Seção 2.5).

Phylogeny based in 16S rRNA gene

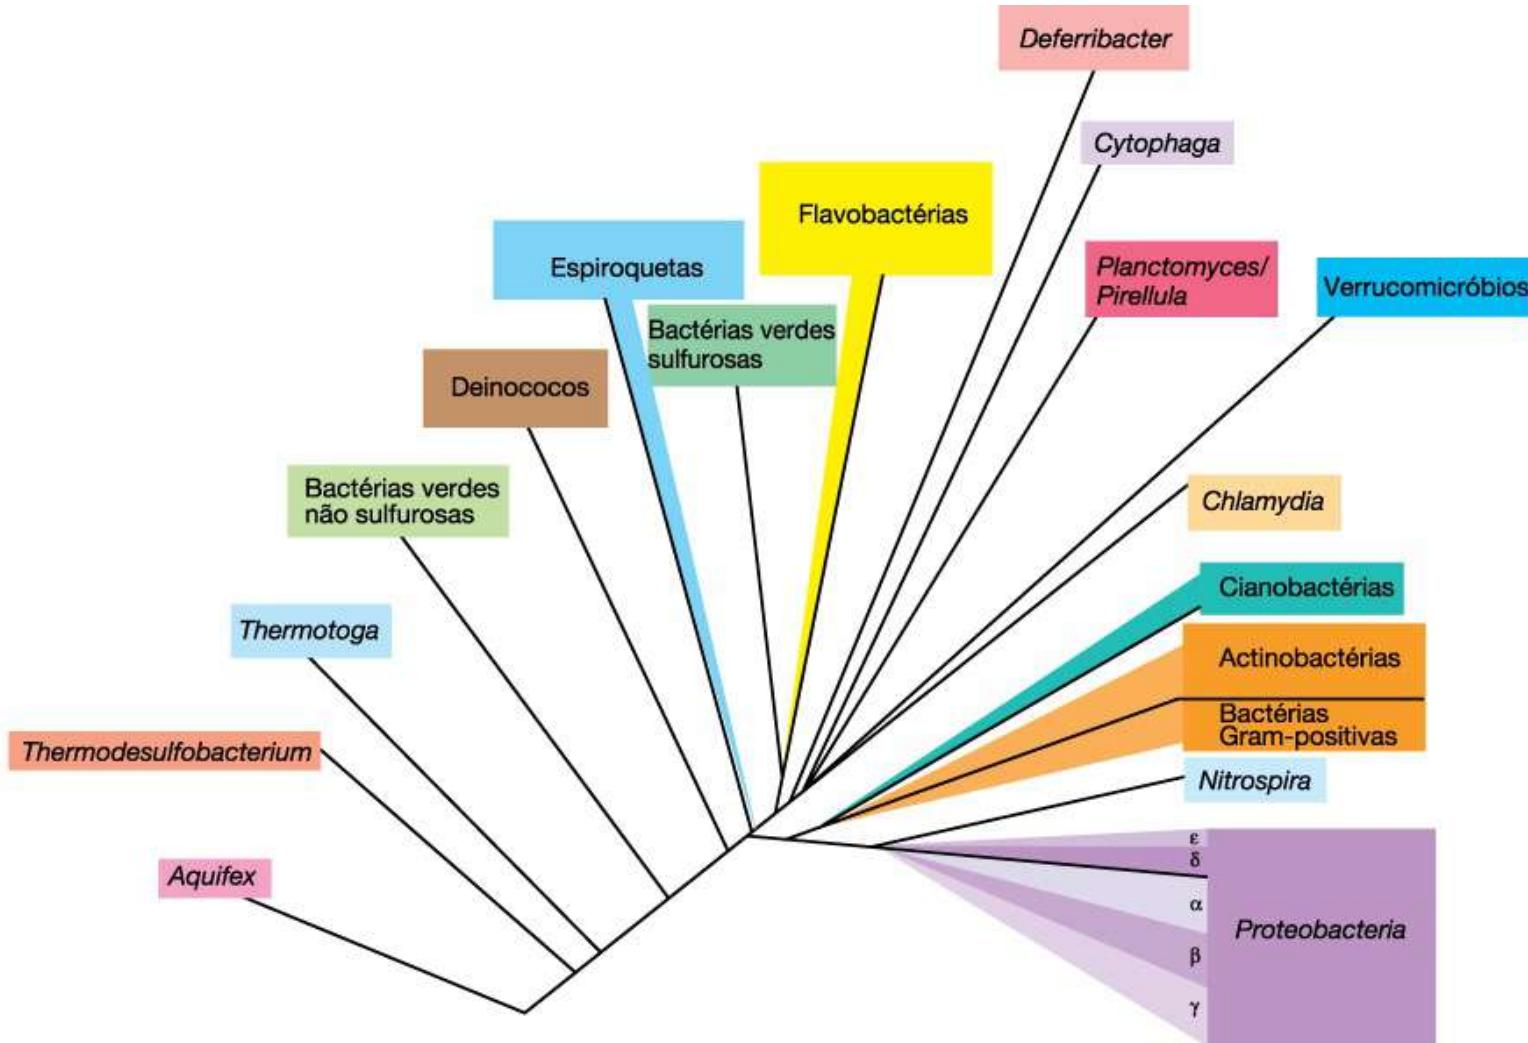

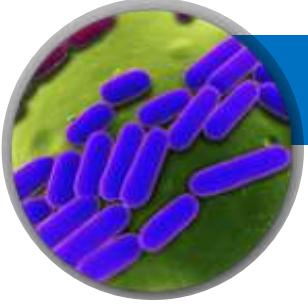

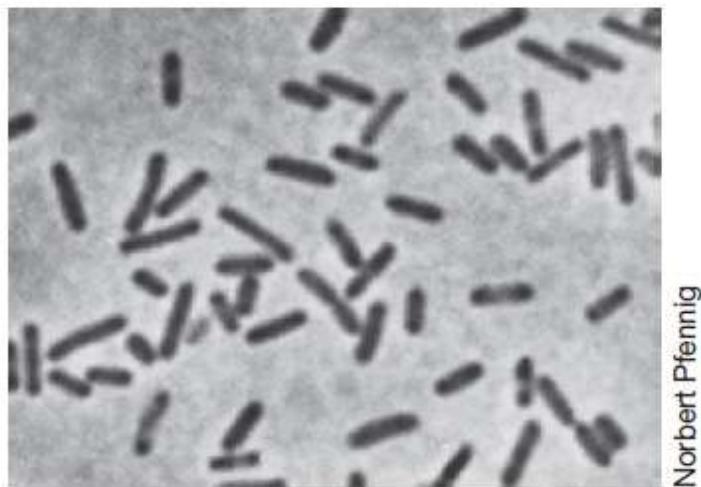

Figura 15.1 Principais linhagens (filos) de Bacteria, com base nas comparações das sequências do gene de RNA ribossomal 16S. Atualmente são conhecidos mais de 80 filos de Bacteria, incluindo muitos filos conhecidos somente a partir de sequências ambientais obtidas em amostragens de comunidades.

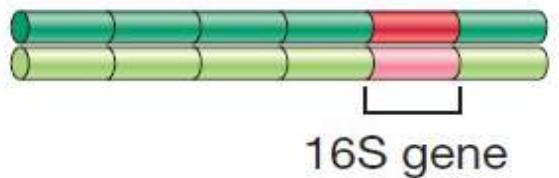

Como se faz filogenia molecular?

“Microbial Dark Matter”

- ❖ Microbes are the most abundant and diverse cellular life forms on Earth and colonize a wide range of environmental niches.
- ❖ However, more than 99% of bacterial and archaeal species have not been obtained in pure culture and we have only glimpsed the surface of this **mysterious microbial world**.
- ❖ This is so-called **Microbial Dark Matter** (MDM): the enormous diversity of yet-uncultivated microbes that microbiologists can only study by using cultivation-independent techniques.

Uncovering Earth's virome

David Paez-Espino¹, Emiley A. Eloe-Fadrosh¹, Georgios A. Pavlopoulos¹, Alex D. Thomas¹, Marcel Huntemann¹, Natalia Mikhailova¹, Edward Rubin^{1,2,3}, Natalia N. Ivanova¹ & Nikos C. Kyrpides¹

Viruses are the most abundant biological entities on Earth, but challenges in detecting, isolating, and classifying unknown viruses have prevented exhaustive surveys of the global virome. Here we analysed over 5 Tb of metagenomic sequence data from 3,042 geographically diverse samples to assess the global distribution, phylogenetic diversity, and host specificity of viruses. We discovered over 125,000 partial DNA viral genomes, including the largest phage yet identified, and increased the number of known viral genes by 16-fold. Half of the predicted partial viral genomes were clustered into genetically distinct groups, most of which included genes unrelated to those in known viruses. Using CRISPR spacers and transfer RNA matches to link viral groups to microbial host(s), we doubled the number of microbial phyla known to be infected by viruses, and identified viruses that can infect organisms from different phyla. Analysis of viral distribution across diverse ecosystems revealed strong habitat-type specificity for the vast majority of viruses, but also identified some cosmopolitan groups. Our results highlight an extensive global viral diversity and provide detailed insight into viral habitat distribution and host-virus interactions.

THE FIRST SYNTHETIC LIVING CREATURE

It's alive!!!

Dr. Frankenstein, 1818

“...enquadrado na tradição da novela gótica, o texto fala sobre temas como moralidade científica, criação e destruição de vida e ousadia da humanidade em sua relação com Deus...”

China-US scientists grow first human-monkey embryo, but is it ethical?

- It's not in bad taste, says Chinese researcher after injecting human stem cells into macaque embryos to explore possibility of growing organs for transplants
- Most of the embryos died and others grew only low levels of human cells, but the progress achieved leads some to raise fears over where the experiments may lead
