

# Antibiotics

What are antibiotics?

Who are the main producers?

Biological functions?

Resistance

New developments

# First antimicrobial approaches

Louis Pasteur (1822-1895):

“pasteurization”

Fermentation: wine  
contamination

Germ theory: silkworm disease

Vaccine: anthrax, fowl cholera

Rabies

# First antimicrobial drugs

## Paul Ehrlich (1854-1915):

- Methylene blue: malaria
- Toxin and antitoxin
- Salvarsan: magic bullet  
against syphilis, *Treponema pallidum*

# First antimicrobial drugs

- **Gerhard Domagk (Nobel Prize 1939)**

Sulfa drugs

Prontosil

Sulfanilamide, analog of p-aminobenzoic acid  
(part of folic acid, precursor of nucleic acids)

Development of antituberculosis compounds  
thiosemicarbasone and isoniazid

***Penicillium*  
colony**

**Area of  
inhibition of  
bacterial growth**

1928 Alexander Fleming

1940 Howard Florey  
Ernst Chain

1954 Cephalosporin C

**Normal  
bacterial  
colony**

***Staphylococcus aureus***

# Primary and secondary metabolism

# What are antibiotics?

- Secondary metabolites synthesized by some microorganisms

# Who are the main producers

- Bacteria

Gram positive *Streptomyces*

- Fungi
- Other bacteria

**TABLE 20.1****Representative Sources  
of Antibiotics**

Microorganism	Antibiotic
<b>Gram-Positive Rods</b>	
<i>Bacillus subtilis</i>	Bacitracin
<i>Paenibacillus polymyxa</i>	Polymyxin
<b>Actinomycetes</b>	
<i>Streptomyces nodosus</i>	Amphotericin B
<i>Streptomyces venezuelae</i>	Chloramphenicol
<i>Streptomyces aureofaciens</i>	Chlortetracycline and tetracycline
<i>Saccharopolyspora erythraea</i>	Erythromycin
<i>Streptomyces fradiae</i>	Neomycin
<i>Streptomyces griseus</i>	Streptomycin
<i>Micromonospora purpurea</i>	Gentamicin
<b>Fungi</b>	
<i>Cephalosporium</i> spp.	Cephalothin
<i>Penicillium griseofulvum</i>	Griseofulvin
<i>Penicillium chrysogenum</i>	Penicillin

# MICROORGANISMS and BIOACTIVE COMPOUNDS

**Antitumorals**

**Antifungals**

**Bioactives**

# BIOACTIVE COMPOUNDS SYNTHESIZED BY ACTINOBACTERIA

## ANTIBACTERIALS

Erythromycin  
Tetracycline  
Gentamicin

## ANTIFUNGALS

Amphotericin B  
Nystatin

## ANTIPARASITICS

Avermectins

## ANTITUMORALS

Doxorubicin  
Mitramycin  
Bleomycin

## IMUNOSUPPRESSANTS

Rapamycin  
FK506

## INSETICIDES

Espinosin

## HERBICIDES

Bialaphos

# Biological functions of antibiotics?

- In the producer:

Activators of morphological differentiation, UV protector, communication

- In the target microorganism:  
Toxicity

Figure 20-9a Brock Biology of Microorganisms 11/e  
© 2006 Pearson Prentice Hall, Inc.

Figure 20-9b Brock Biology of Microorganisms 11/e

Figure 20-9c Brock Biology of Microorganisms 11/e  
© 2006 Pearson Prentice Hall, Inc.

<b>Antibiotic classification</b>	<b>Subclassification</b>	<b>Example</b>
<b>I. Carbohydrate-containing compounds</b>	Pure sugars Aminoglycosides Orthosomycins N-Glycosides C-Glycosides Glycolipids	Nojirimycin Streptomycin Everninomicin Streptothricin Vancomycin Moenomycin
<b>II. Macrocyclic lactones</b>	Macrolide antibiotics Polyene antibiotics Ansamycins Macrotetrolides	Erythromycin Candididin Rifampin Tetranactin
<b>III. Quinones and related compounds</b>	Tetracyclines Anthracyclines Naphthoquinones Benzoquinones	Tetracycline Adriamycin Actinorhodin Mitomycin

## Representative structure

Figure 20-13 part 1 Brock Biology of Microorganisms 11/e  
© 2006 Pearson Prentice Hall, Inc.

## Antibiotic classification

### IV. Amino acid and peptide analogs

#### Subclassification

Amino acid derivatives  
β-Lactam antibiotics

Peptide antibiotics  
Chromopeptides  
Depsipeptides  
Chelate-forming peptides

#### Example

Cycloserine  
Penicillin,  
ceftriaxone  
Bacitracin  
Actinomycin  
Valinomycin  
Bleomycin

### V. Heterocyclic compounds containing nitrogen

Nucleoside antibiotics

Polyoxins

### VI. Heterocyclic compounds containing oxygen

Polyether antibiotics

Monensin

## Representative structure

**Antibiotic classification****VII. Alicyclic derivatives****Subclassification**

Cycloalkane derivatives  
Steroid antibiotics

**Example**

Cycloheximide  
Fusidic acid

**VIII. Aromatic compounds**

Benzene derivatives  
Condensed aromatics  
Aromatic ether

Chloramphenicol  
Griseofulvin  
Novobiocin

**IX. Aliphatic compounds**

Compounds containing phosphorus

Fosfomycin

**Representative structure**

## Antibiotic classification

## Subclassification

## Example

**X. Quinolone compounds**

4-Quinolone  
Fluoro-4-quinolones

Nalidixic acid  
Ciprofloxacin

**XI. Oxazolidinone**

Cyclic lactone

2-Oxazolidinone

## Representative structure

Fosfomycin

2-Oxazolidinone

Nalidixic acid

**TABLE 20.3****Antibacterial Drugs**

Drugs by Mode of Action	Comments
<b>Inhibitors of Cell Wall Synthesis</b>	
<b>Natural Penicillins</b>	
Penicillin G	Against gram-positive bacteria, requires injection
Penicillin V	Against gram-positive bacteria, oral administration
<b>Semisynthetic Penicillins</b>	
Oxacillin	Resistant to penicillinase
Ampicillin	Broad spectrum
Amoxicillin	Broad spectrum; combined with inhibitor of penicillinase
Aztreonam	A monobactam; effective for gram-negative bacteria, including <i>Pseudomonas</i> spp.
Imipenem	A carbapenem; very broad spectrum
<b>Cephalosporins</b>	
Cephalothin	First-generation cephalosporin; activity similar to penicillin; requires injection
Cefixime	Third-generation cephalosporin; oral administration

**TABLE 20.3****Antibacterial Drugs** *(continued)*

Drugs by Mode of Action	Comments
<b>Polypeptide Antibiotics</b>	
Bacitracin	Against gram-positive bacteria; topical application
Vancomycin	A glycopeptide type; penicillinase-resistant; against gram-positive bacteria
<b>Antimycobacterial Antibiotics</b>	
Isoniazid	Inhibits synthesis of mycolic acid component of cell wall of <i>Mycobacterium</i> spp.
Ethambutol	Inhibits incorporation of mycolic acid into cell wall of <i>Mycobacterium</i> spp.
<b>Inhibitors of Protein Synthesis</b>	
Chloramphenicol	Broad spectrum, potentially toxic
<b>Aminoglycosides</b>	
Streptomycin	Broad spectrum, including mycobacteria
Neomycin	Topical use, broad spectrum
Gentamicin	Broad spectrum, including <i>Pseudomonas</i> spp.
<b>Tetracyclines</b>	
Tetracycline, oxytetracycline, chlortetracycline	Broad spectrum, including chlamydias and rickettsias; animal feed additives
<b>Macrolides</b>	
Erythromycin	Alternative to penicillin
Azithromycin, clarithromycin	Semisynthetic; broader spectrum and better tissue penetration than erythromycin
Telithromycin (Ketek)	New generation of semisynthetic macrolides; used to cope with resistance to other macrolides

**TABLE 20.3****Antibacterial Drugs** *(continued)*

Drugs by Mode of Action	Comments
<b>Streptogramins</b>	
Quinupristin and dalfopristin (Synercid)	Alternative for treating vancomycin-resistant gram-positive bacteria
<b>Oxazolidinones</b>	
Linezolid (Zyvox)	Useful primarily against penicillin-resistant gram-positive bacteria
<b>Injury to the Plasma Membrane</b>	
Polymyxin B	T opical use, gram-negative bacteria, including <i>Pseudomonas</i> spp.
<b>Inhibitors of Nucleic Acid Synthesis</b>	
<b>Rifamycins</b>	
Rifampin (or rifampicin)	Inhibits synthesis of mRNA; treatment of tuberculosis
<b>Quinolones and Fluoroquinolones</b>	
Nalidixic acid, norfloxacin, ciprofloxacin	Inhibit DNA synthesis; broad spectrum; urinary tract infections
Gatifloxacin	Newest generation quinolone; increased potency against gram-positive bacteria
<b>Competitive Inhibitors of the Synthesis of Essential Metabolites</b>	
<b>Sulfonamides</b>	
Trimethoprim-sulfamethoxazole	Broad spectrum; combination is widely used

### (a) Natural penicillins

Penicillin G (Requires injection)

Narrow spectrum of microbial activity

Penicillin V (Can be taken orally)

### (b) Semisynthetic penicillins

Oxacillin

Narrow spectrum, only gram-positives, but resistant to penicillinase

Ampicillin

Extended spectrum, many gram-negatives

Broad spectrum antibiotic

William Cummings.

Figure 20.6 - Overview

Structure of  
peptidoglycan  
glycan  
tetrapeptide

**(b)** The bacterial cell is lysing as penicillin weakens the cell wall.

SEM

1  $\mu\text{m}$

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

**(a)** Three-dimensional detail of the protein synthesis site showing the 30S and 50S subunit portions of the 70S prokaryotic ribosome.

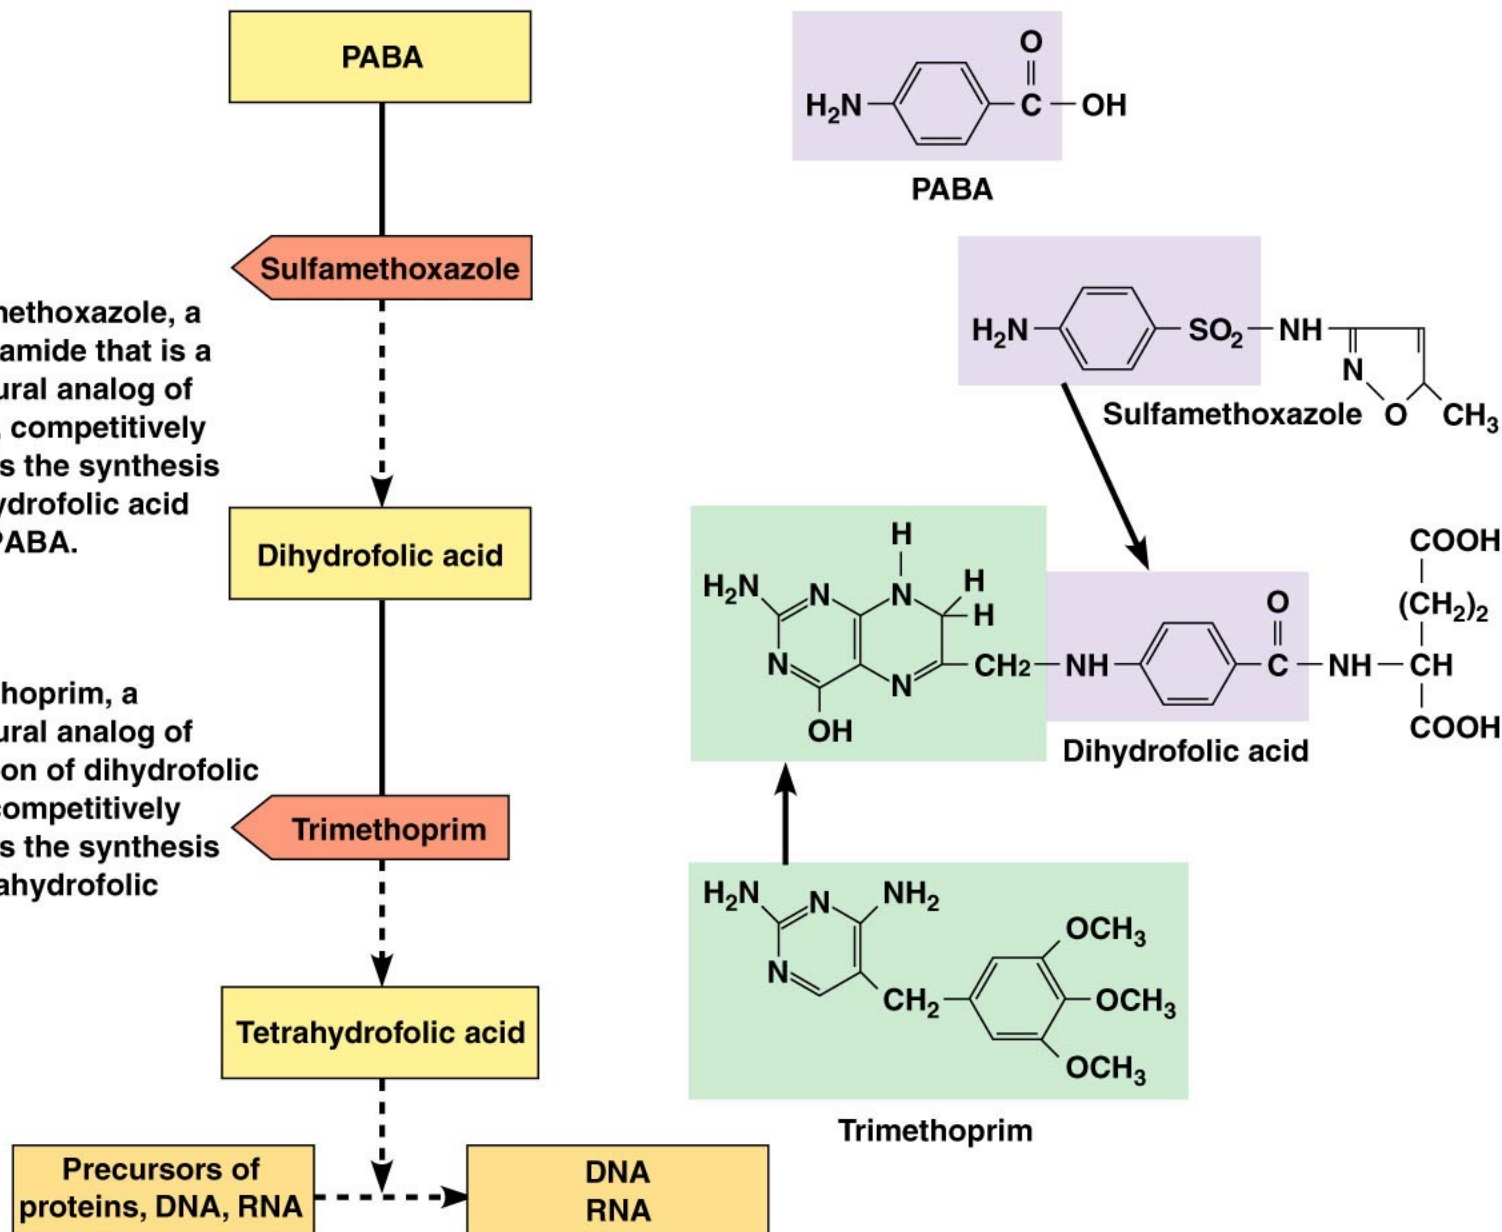

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

**(b)** In the diagram the black arrows indicate the different points at which chloramphenicol, the tetracyclines, and streptomycin exert their activities.

**1** Sulfamethoxazole, a sulfonamide that is a structural analog of PABA, competitively inhibits the synthesis of dihydrofolic acid from PABA.

**2** Trimethoprim, a structural analog of a portion of dihydrofolic acid, competitively inhibits the synthesis of tetrahydrofolic acid.

**Membrane functions:**  
Polyenes bind to ergosterol and disrupt membrane integrity

**Cell wall synthesis:**  
Polyoxins inhibit chitin synthesis  
Echinocandins inhibit glucan synthesis

**Ergosterol synthesis:**  
Azoles and Allylamines inhibit synthesis

**Nucleic acid synthesis:**  
5-Fluorocytosine is a nucleotide analog that inhibits nucleic acid synthesis

**Microtubule formation:**  
Griseofulvin disrupts microtubule aggregation during mitosis

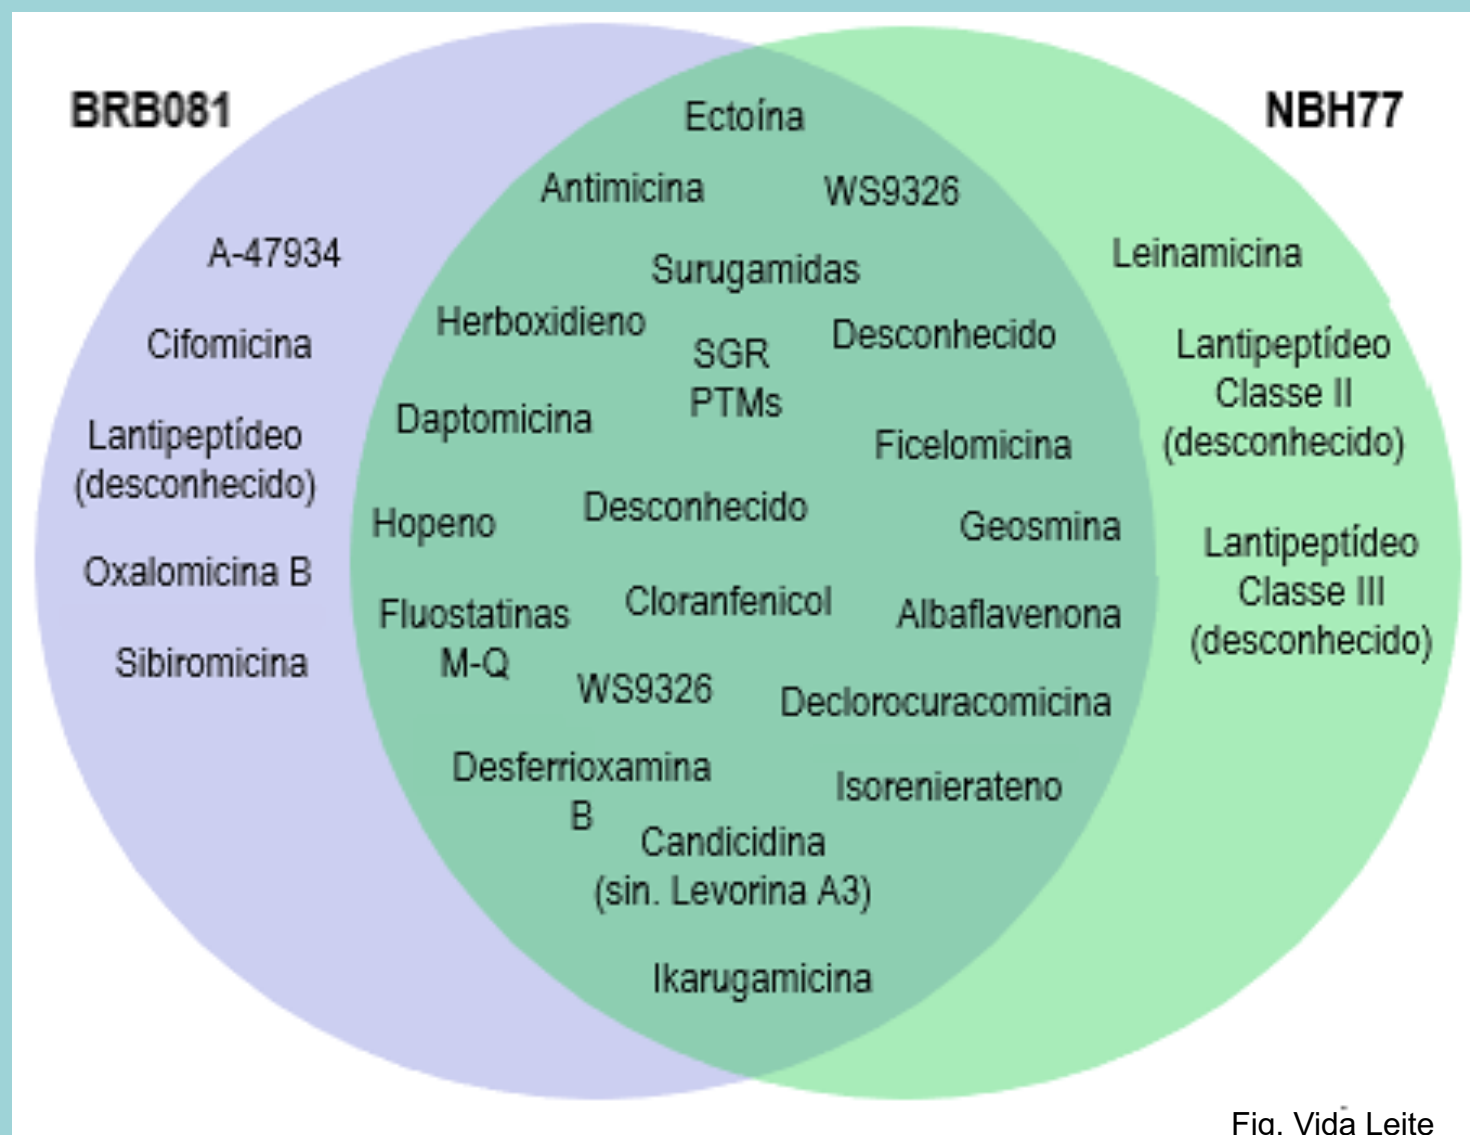

Fig. Vida Leite

Comparação entre (A) BGC putativo de sibiromicina de BRB081 e (B) BGC de sibiromicina de *Streptosporangium sibiricum* (LI et al., 2009). Os limites de A foram definidos com base em homologia. As ORFs correlacionadas entre A e B são representadas pela mesma cor. As linhas pontilhadas conectam ORFs relacionadas e dispostas na mesma ordem.

Injury of plasma membrane of a yeast caused by antifungal drug

**TABLE 20.4****Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs**

	Mode of Action	Comments
<b>Antifungal Drugs</b>		
<b>Agents Affecting Fungal Sterols (Plasma Membrane)</b>		
<b>Polyenes</b>		
Amphotericin B	Injury to plasma membrane	Systemic fungal infections; fungicidal
<b>Azoles</b>		
Clotrimazole, miconazole	Inhibit synthesis of plasma membrane	Topical use
Ketoconazole	Inhibits synthesis of plasma membrane	Can be taken orally for systemic fungal infections
Voriconazole	Inhibits synthesis of plasma membrane	Can penetrate blood–brain barrier to treat aspergillosis of the central nervous system
<b>Allylamines</b>		
Terbinafine, naftifine	Inhibits synthesis of plasma membrane	New class of antifungals frequently used to treat diseases resistant to azoles
<b>Agents Affecting Fungal Cell Walls</b>		
<b>Echinocandins</b>		
Caspofungin (Candidas)	New class of antifungals that inhibit synthesis of cell wall	

**TABLE 20.4****Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs** *(continued)*

	Mode of Action	Comments
<b>Agents Inhibiting Nucleic Acids</b>		
Flucytosine	Inhibits synthesis of RNA and therefore protein synthesis	
<b>Other Antifungal Drugs</b>		
Griseofulvin	Inhibition of mitotic microtubules	Fungal infections of the skin
Tolnaftate	Unknown	Athlete's foot
<b>Antiviral Drugs</b> (See also Table 20.5, Drugs for Chemotherapy of HIV)		
<b>Nucleoside and Nucleotide Analogs</b>		
Acyclovir, ganciclovir, ribavirin, lamivudine	Inhibit DNA or RNA synthesis	Used primarily against herpesviruses
Cidofovir	Inhibits DNA or RNA synthesis	Cytomegalovirus infections; possibly effective against smallpox
Adefovir dipivoxil (Hepsera)		For resistance against lamivudine
<b>Attachment and Uncoating</b>		
Zanamivir, oseltamivir	Inhibit neuraminidase on influenza virus	Treatment of influenza
Amantadine, zidantadine	Inhibit uncoating	Treatment of influenza
<b>Interferons</b>		
alpha-interferon	Inhibits spread of virus to new cells	Viral hepatitis

**TABLE 20.4****Antifungal, Antiviral, Antiprotozoan, and Anthelmintic Drugs** *(continued)*

	Mode of Action	Comments
<b>Antiprotozoan Drugs</b>		
Chloroquine	Inhibits DNA synthesis	Malaria; effective against red blood cell stage only
Diiodohydroxyquin	Unknown	Amoebic infections; amoebicidal
Metronidazole, Tinidazole	Interferes with anaerobic metabolisms	Giardiasis, amebiasis, trichomoniasis
Nitazoxanide	Interferes with anaerobic metabolism	Giardiasis; only drug approved for cryptosporidiosis
<b>Anthelmintic Drugs</b>		
Niclosamide	Prevents ATP generation in mitochondria	Tapeworm infections; kills tapeworms
Praziquantel	Alters permeability of plasma membranes	Tapeworm and fluke infections; kills flatworms
Pyantel pamoate	Neuromuscular block	Intestinal roundworms; kills roundworms
Mebendazole, albendazole	Inhibit absorption of nutrients	Intestinal roundworms
Ivermectin	Paralyzes worm	Intestinal roundworms primarily; occasional use for scabies mite and lice

Guanine

Deoxyguanosine

Acyclovir

**(a) Acyclovir structurally resembles the nucleoside deoxyguanosine.**

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

**(b) The enzyme thymidine kinase combines phosphates with nucleosides to form nucleotides, which are then incorporated into DNA.**

Copyright © 2007 Pearson Education, Inc., publishing as Benjamin Cummings.

- (c)** Acyclovir has no effect on a cell not infected by a virus, that is, with normal thymidine kinase. In a virally infected cell, the thymidine kinase is altered and converts the acyclovir (which resembles the nucleoside deoxyguanosine) into a false nucleotide—which blocks DNA synthesis by DNA polymerase.
