Celulose
(ligações β -1,4)

Amido e glicogênio
(ligações α -1,4)

Metabolismo de Glicogênio

Principal polissacarídeo de reserva em animais

Polímero com estrutura ramificada, resíduos de glicose unidos por ligações glicosídicas α -1,4 e ramificações α -1,6.

Regula níveis glicêmicos (fígado, cerca de 12-24 horas)

Reserva de glicose para atividade muscular intensa

Síntese do Glicogênio

fosfoglicomutase

Síntese do Glicogênio

Uridine diphosphate glucose (UDPG)

UDP-glucose pyrophosphorylase

Síntese do Glicogênio

fosfoglicomutase

UDP-glicose pirofosforilase

Síntese do Glicogênio

(a)

Síntese do Glicogênio

Nonreducing end of a glycogen chain with n residues ($n > 4$)

glycogen synthase
→ UDP

New nonreducing end

Elongated glycogen with $n + 1$ residues

Síntese do Glicogênio - Ramificação

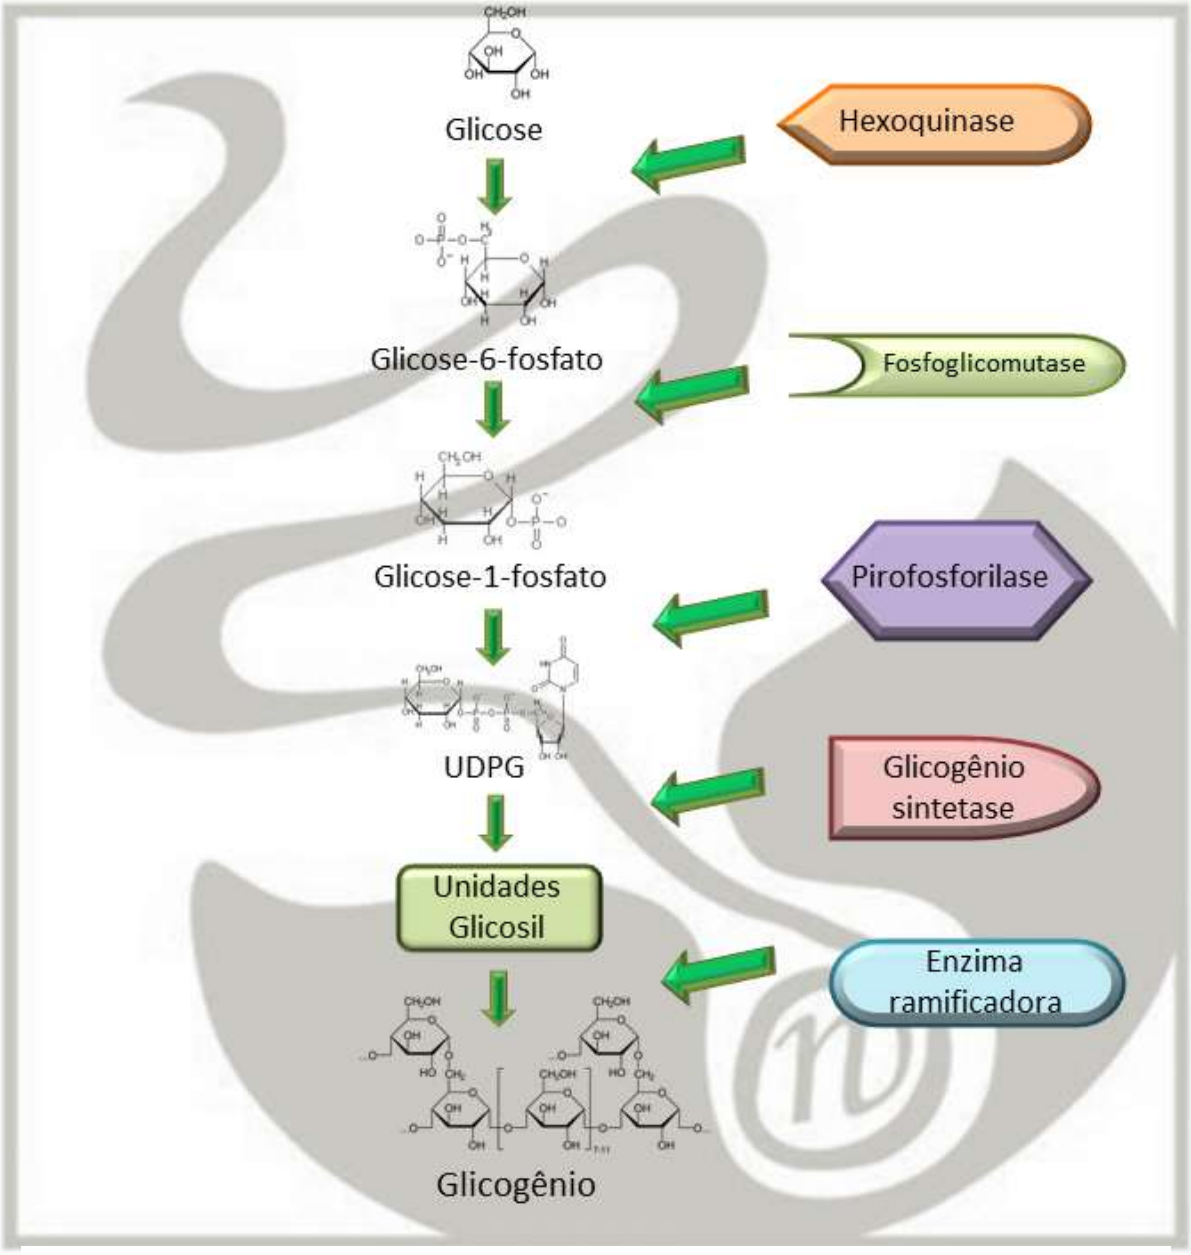

Figure 15-11 Fundamentals of Biochemistry, 2/e
 © 2006 John Wiley & Sons

Síntese do Glicogênio - Ramificação

 glicogenina	 terceira camada
 iniciador	 quarta camada
 segunda camada	 camada externa (não ramificada)

Gasto energético na síntese do glicogênio

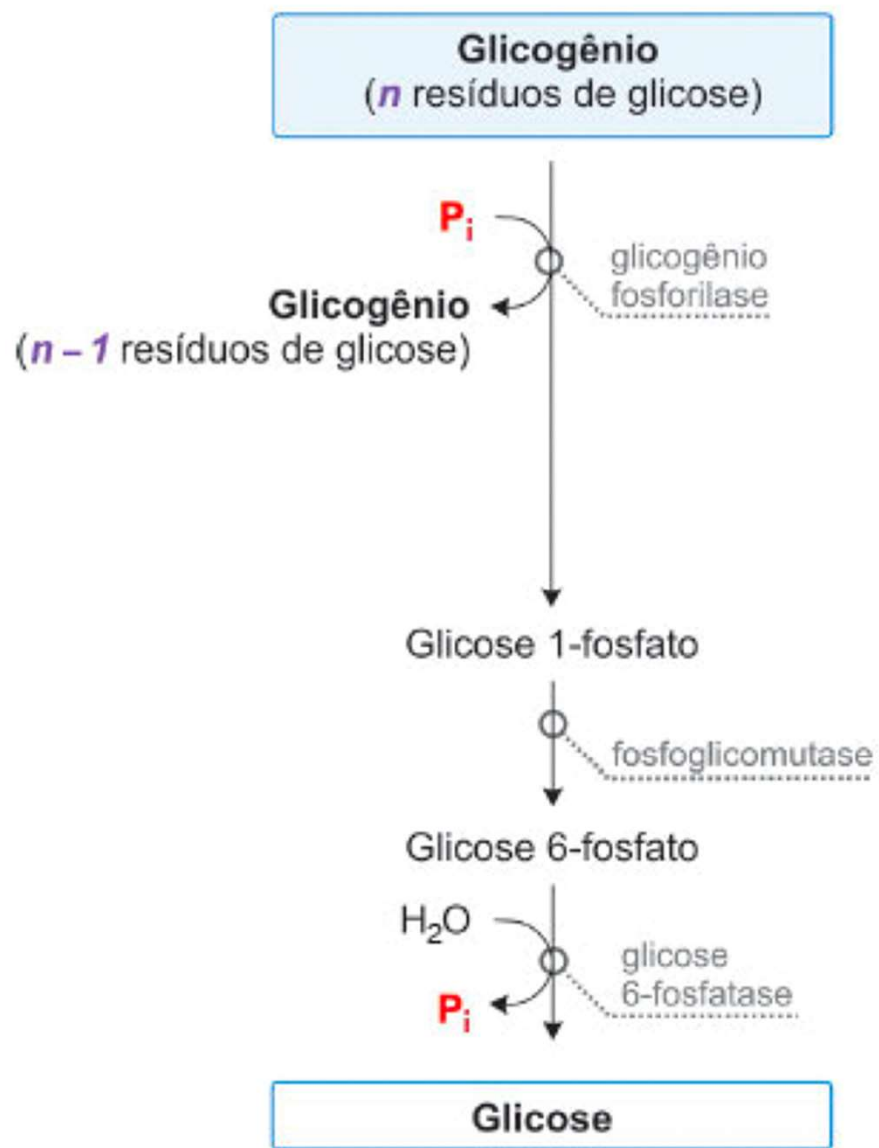

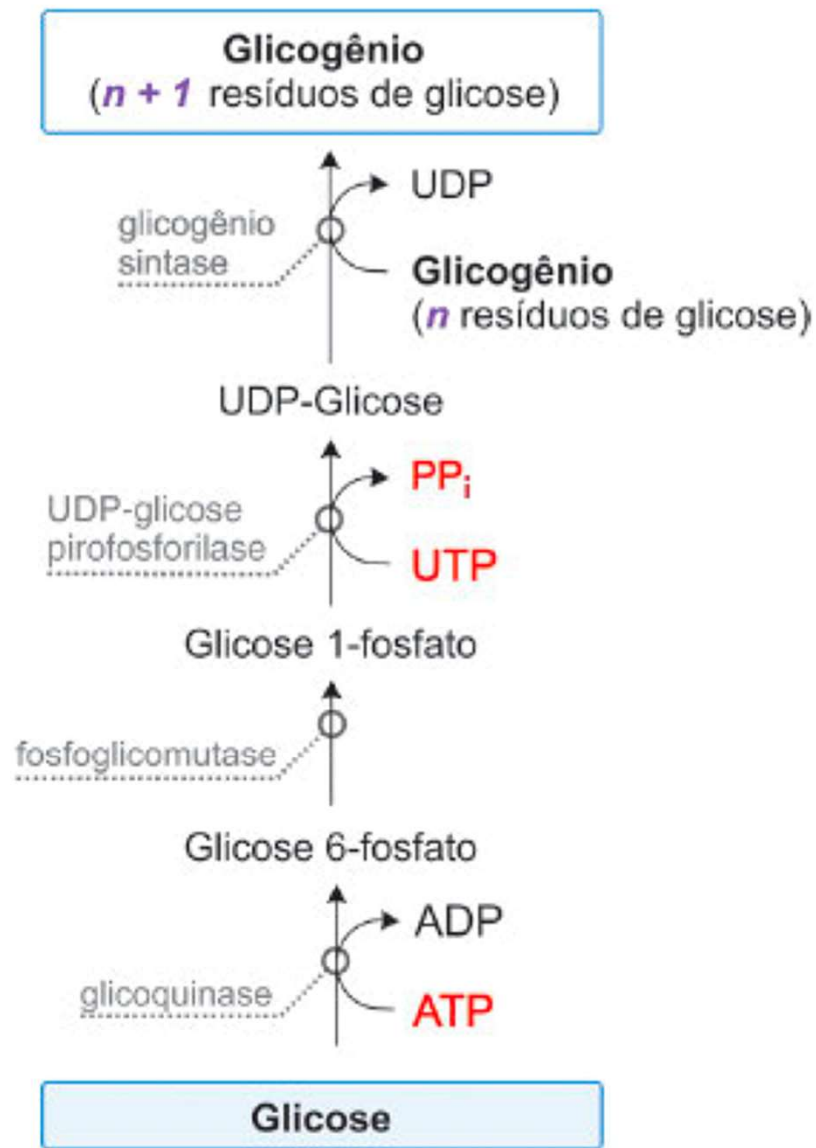

DEGRADAÇÃO

SÍNTESE

Figure 15.49. Variation of liver glycogen content between meals and during the nocturnal fast.

Metabolismo do Glicogênio

Regulação

Ronaldo Bento Quaggio

QBQ0221 - Bioquímica

Tabela 19.4 Transportadores de glicose em mamíferos.

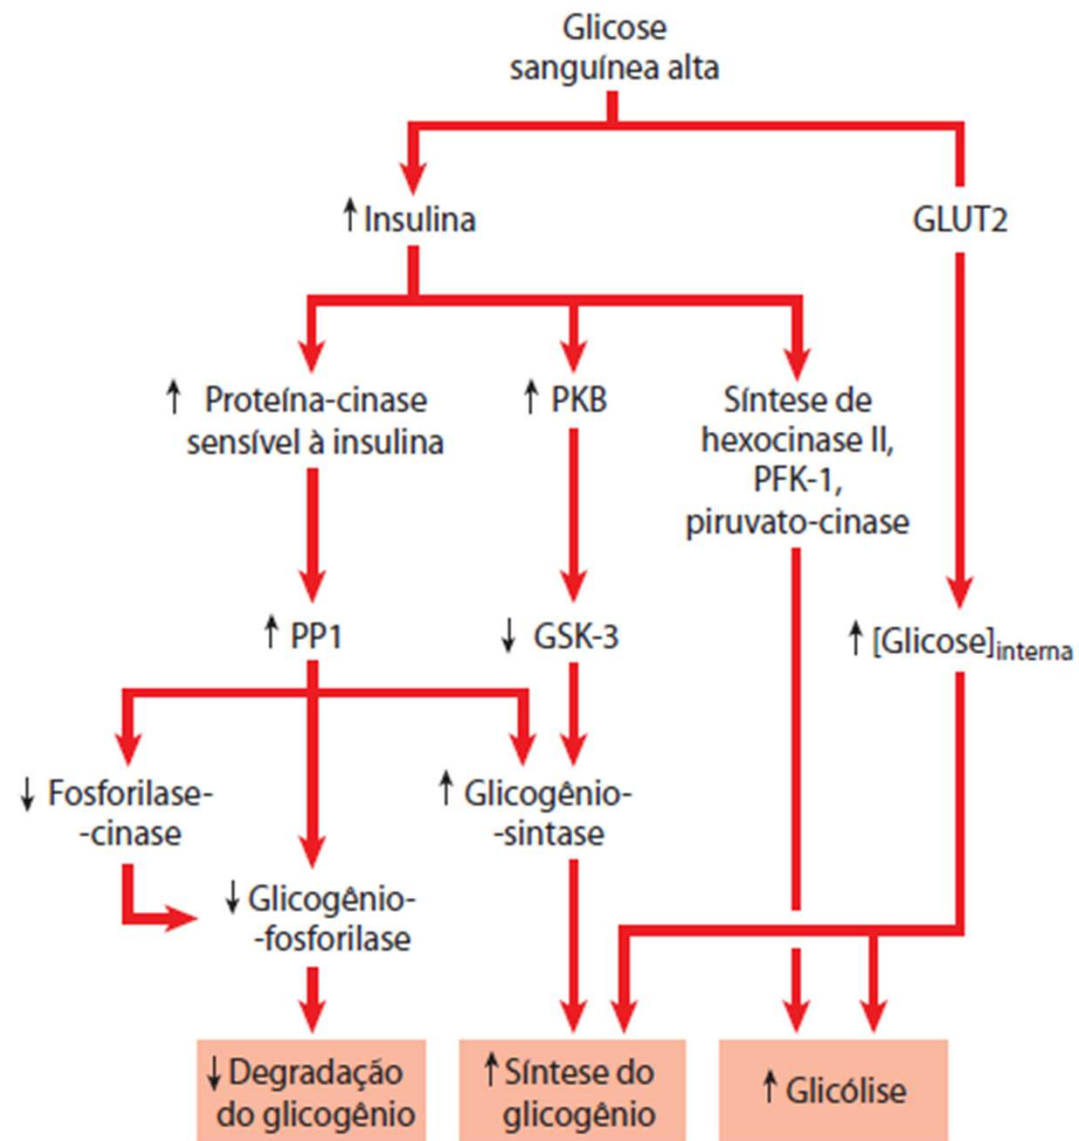

Transportador	Localização	K_M para glicose (mM)	Dependência de insulina
GLUT 1	Todos os tecidos, abundante em cérebro e hemácias	1-5	Não
GLUT 2	Fígado, células β do pâncreas, rins, intestino delgado	15-25	Não
GLUT 3	Cérebro	1-5	Não
GLUT 4	Tecido adiposo, músculos esqueléticos e cardíaco	1-5	Sim

Concentração normal de glicose sanguínea = 5 a 8 mM.

Regulação da Glicogênio Sintase

- Forma fosforilada é inativa
- Insulina inibe fosforilação
- Insulina estimula desfosforilação
- Glucagon/Adrenalina - fosforilação
 - ↑ fígado
 - ↑ músculo
- Glicose (6 P) - ativador PP1

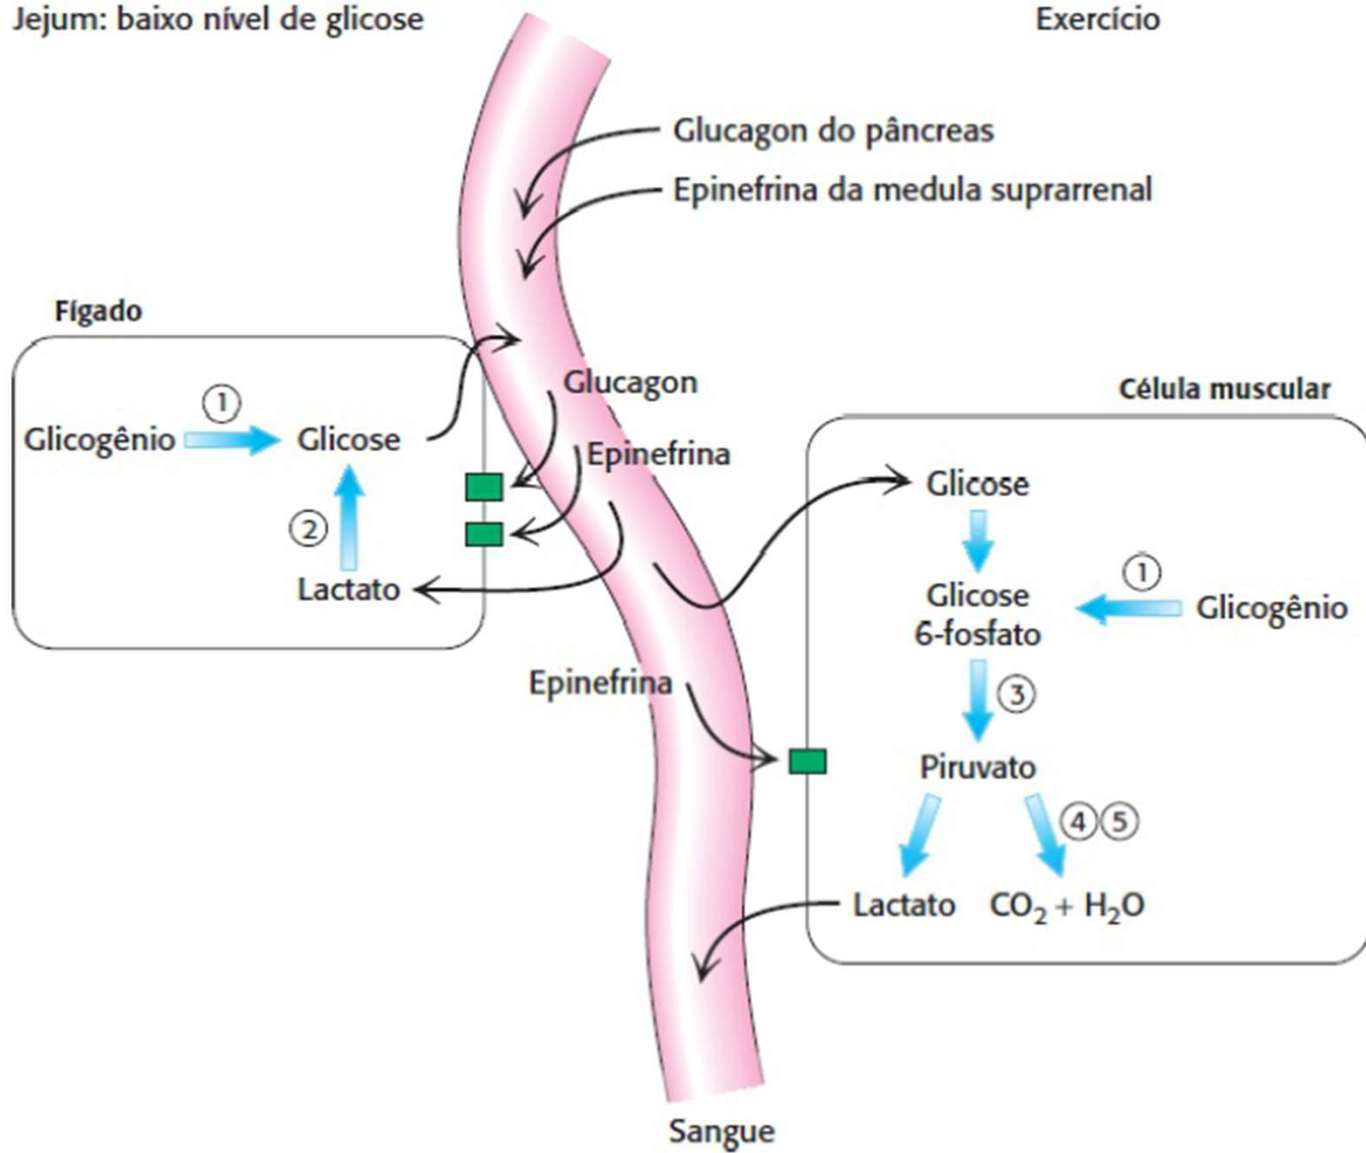

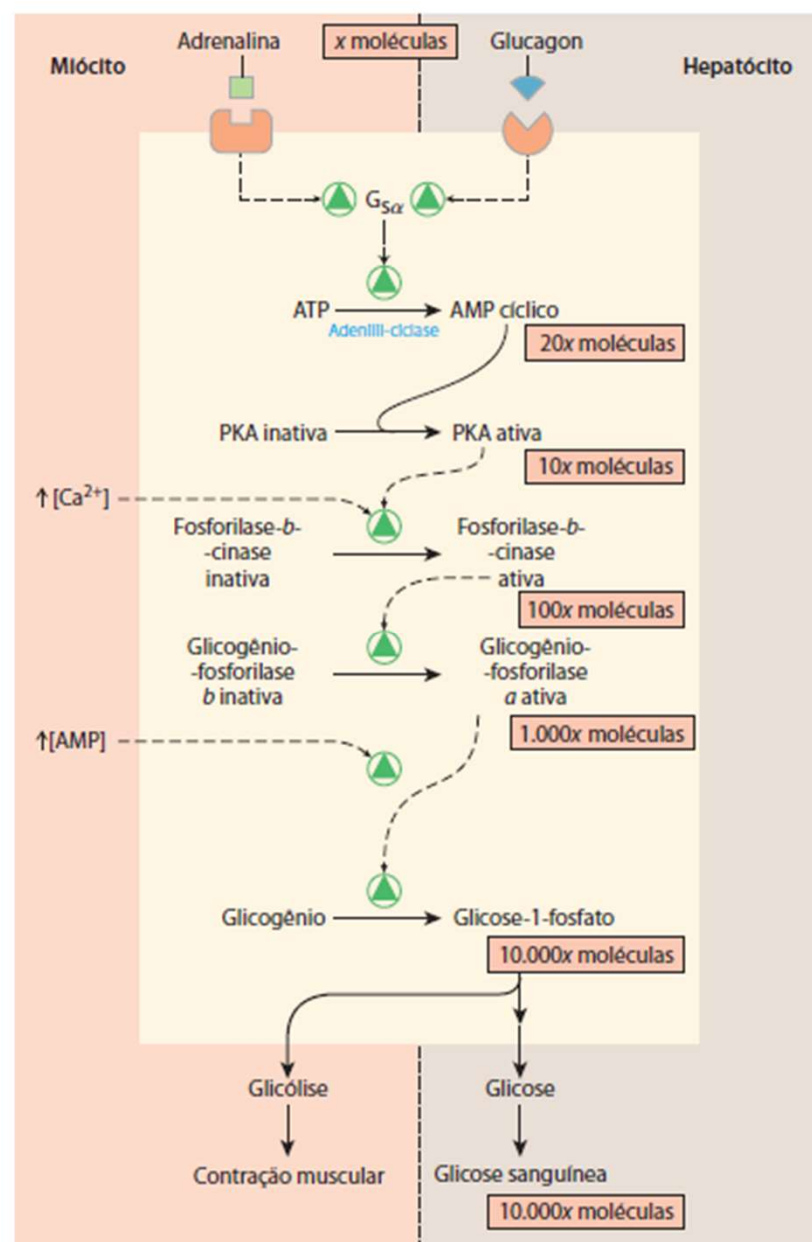

Jejum: baixo nível de glicose

Exercício

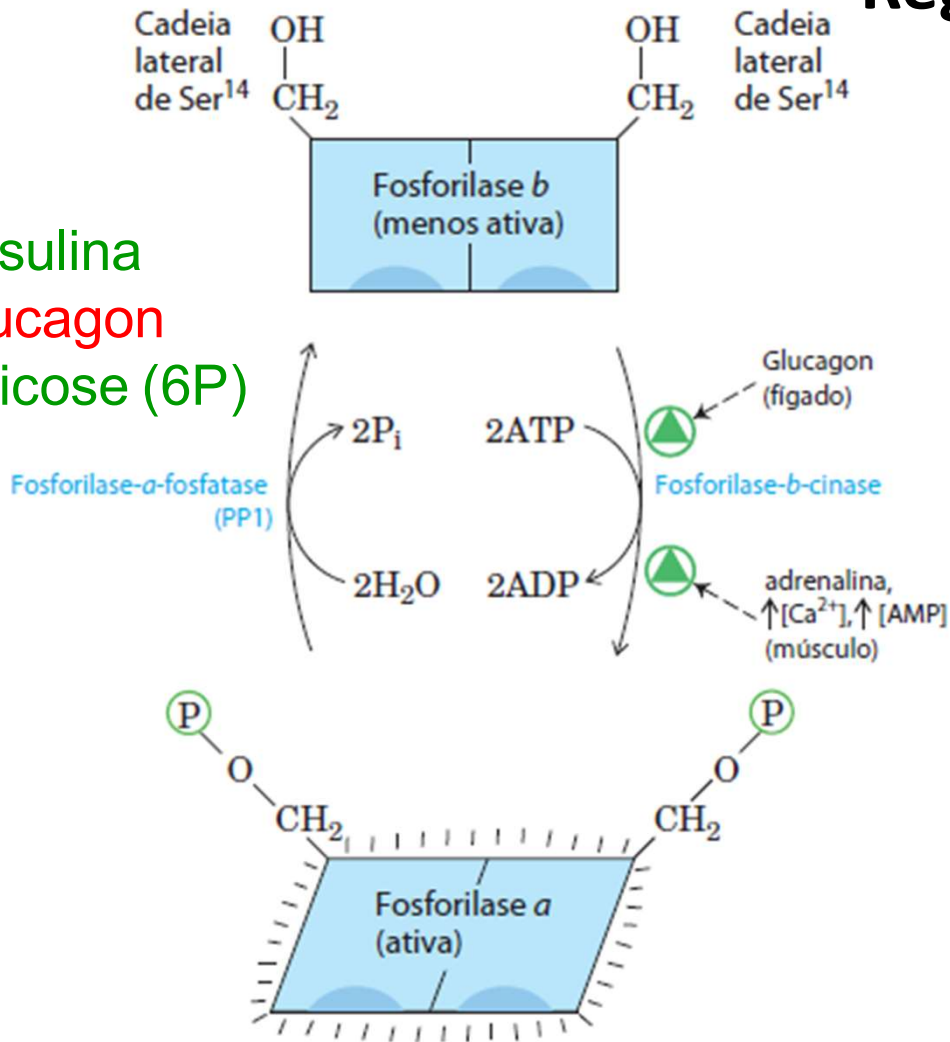

Regulação da Glicogênio Fosforilase

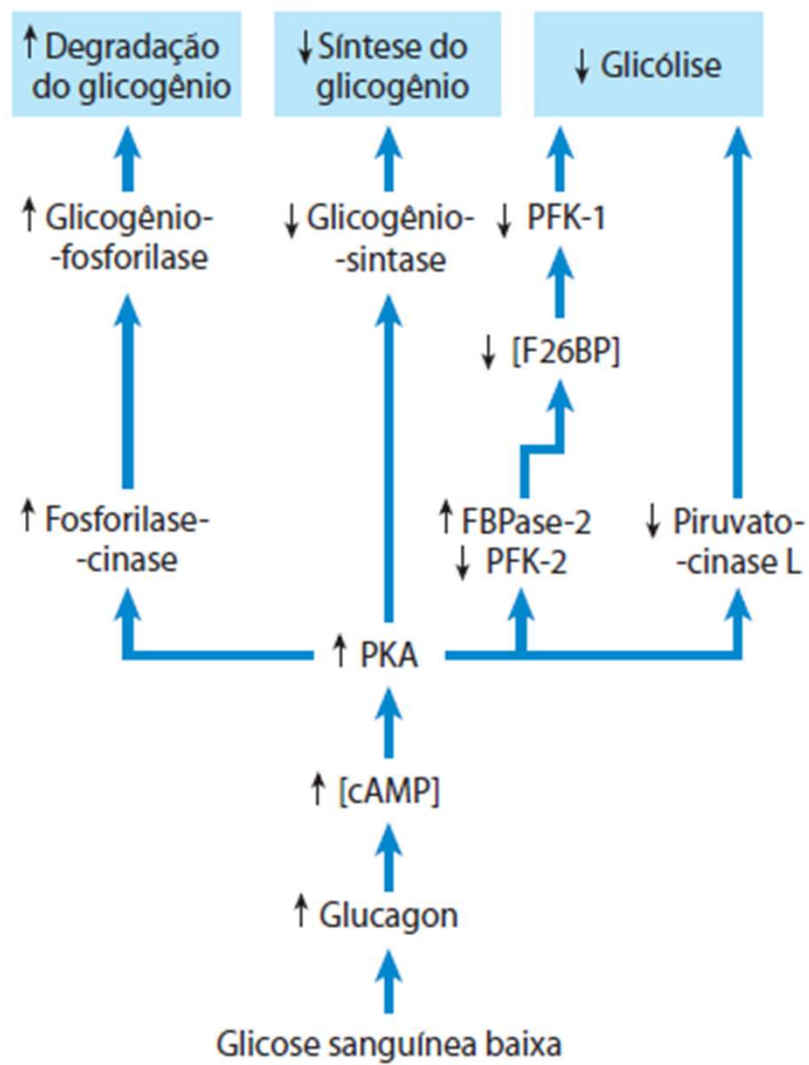

+ insulina
- glucagon
+ glicose (6P)

- Forma fosforilada é mais ativa
- Insulina ativa desfosforilação
- Glicose (6 P) ativa PP1
- Glucagon/Adrenalina = fosforilação
- Ca²⁺ e AMP ativam fosforilação

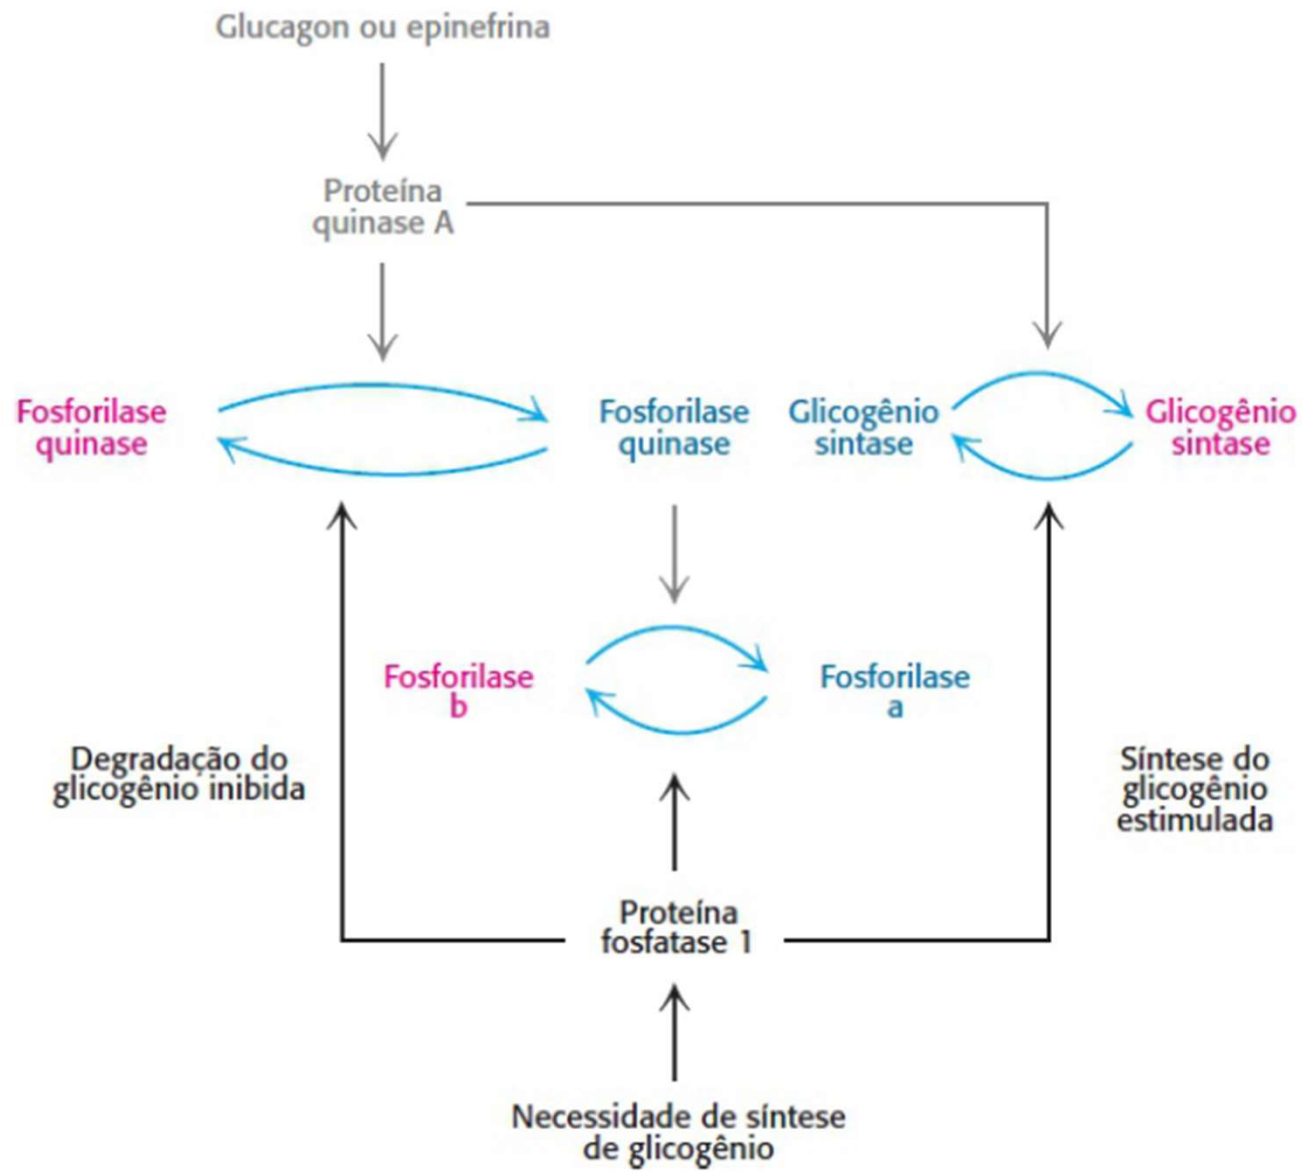

A Glicogênio-Fosforilase do fígado como sensor de glicose

Degradação

Doenças de armazenamento do Glicogénio

Doença	Enzima Defeituosa	Órgão Afectado	Glicogénio no órgão afectado	Características Clínicas
De Von Gierke	Glicose 6-fosfatase ou sistema de transporte	Fígado e Rim	Quantidade Aumentada	Dilatação maciça do fígado; atrasos do desenvolvimento; hipoglicémia grave
De Pompe	A -1,4-Glicosidade	Todos	Aumento maciço da quantidade	Insuficiência cardiorespiratória; causa morte(<10 anos)
De Cori	Amilo – 1,6-glicosidade	Músculo e Fígado	Quantidade Aumentada	= Von Gierke mas com evolução mais suave
De Anderson	Enzima Ramificadora	Fígado e Baço	Quantidade normal	Cirrose progressiva do fígado; insuficiência hepática
De McArdle	Fosforilase	Músculo	Quantidade aumentada	Cãibras musculares dolorosas
De Hers	Fosforilase	Fígado	Quantidade aumentada	= Von Gierke mas com evolução mais suave
