where:  $P_0$  and  $T_0$  are the upstream pressure and temperature

$P_T$  is the pressure downstream of the throttle valve

$C_D$  is the discharge coefficient (determined experimentally)

$R$  is the Reynolds number

$\gamma$  is the specific heat ratio

$$\frac{4A_{th}}{\pi D^2} = \left( 1 - \frac{\cos \psi}{\cos \psi_0} \right) + \frac{2}{\pi} \left[ \frac{a}{\cos \psi} \left( \cos^2 \psi - a^2 \cos^2 \psi_0 \right)^{1/2} + \frac{\cos \psi}{\cos \psi_0} \sin^{-1} \left( \frac{a \cos \psi_0}{\cos \psi} \right) - a \left( 1 - a^2 \right)^{1/2} \sin^{-1} a \right]$$

where:  $a = d/D$ ,  $d$  is the throttle shaft diameter,  $D$  is the throttle bore diameter

$\psi_0$  is the throttle plate angle at the closed bore position

$\psi$  is any opening angle

$$m_h = \frac{C_D A_h P_o}{\sqrt{RT_o}} y^{1/2} \left( \frac{2}{y+1} \right)^{(g+1)/2(y-1)}$$

### 2.3.1 Throttle Position Sensor Technology

In most cases, a TPS is a thick-film resistive potentiometer with a movable contact that instantaneously provides a signal proportional to the throttle shaft position (see Figure 2-2).

$$V_{OUT} = \frac{V_{IN} * R_2}{(R_1 + R_2)}$$

## 2.3.2 Electrical Output vs. Angle

A Throttle Position Sensor's output is typically a linear function from idle to WOT.

Figure 2-3. Typical Dual Track TPS Output vs. Throttle Rotation (Linear).

### 3.2.1 Product Examples

Shown are some pictures of Delphi ETC Air Control Valves with various bore sizes:

### 3.2.2 Functions, Performance Requirements and Features

The functions, performance requirements and features of typical ETC-Air Control Valve Assemblies are listed in Table 3-1.

<b>ETC-ACV Functions:</b>	<ul style="list-style-type: none"><li>• Regulate intake air flow</li><li>• Sense throttle position</li><li>• Provide vacuum signals (i.e. the brake booster, EGR valve, and canister purge system if required)</li><li>• Provide filtered air source if required (i.e. PCV fresh air)</li><li>• Provide mounting features if required</li></ul>
<b>Design Performance Requirements:</b>	<ul style="list-style-type: none"><li>• Maximum air flow capacity</li><li>• Idle air flow resolution (and minimum controllable air flow)</li><li>• Default Position Airflow</li><li>• Throttle Response Time</li><li>• Maximum leak rate (through throttle shaft bearings)</li></ul>
<b>Design Features:</b>	<ul style="list-style-type: none"><li>• Various bore sizes</li><li>• Various valve and bore geometry and valve angles</li><li>• Throttle position sensor (shaft drive)</li><li>• Various Connector Configurations</li><li>• Various Actuator Configurations</li><li>• Optional coolant flow passageway</li><li>• Optional Vacuum ports</li><li>• Optional Fresh Air Port</li></ul>

Table 3-1. Functions, Performance Requirements and Features of Typical Throttle Bodies.

- Valve angle – The edge of the valve is manufactured to provide an angular position when the valve is at the closed bore condition. The higher the valve angle, the more sensitive the air rate is per degree valve rotation.

Figure 3-3 Description of Valve Angle

<b>Characteristic</b>	<b>Specifications</b>	<b>Definition</b>
Regulate Air Flow	Maximum Air Flow Rate	Specify the maximum (wide open throttle) air flow rate with the vacuum level required by the engine. Section 2.0 provides a procedure for determining a rough estimate of required airflow at WOT.
	Minimum Air Flow Rate	Specify the vacuum level and maximum airflow rate when the throttle is at its minimum mechanical position
	Default Air Rate	Specify the vacuum level and airflow rate that the ETC-ACV provides when there is no actuator power.
	Air Flow Curve	A curve of the required airflow rate versus throttle rotation. (The airflow progression is important to consider for idle air control.)
	Noise	The allowable audible noise for the ETC Air Control Valve Assembly at all airflow rates.
	System Voltage	Specify the voltages at which the ETC-ACV actuator is expected to operate.
	System Current	Specify the maximum electrical current to allocate to Air Control Valve actuation. This will also determine wiring harness specifications.
Provide Clean Air Source	Air Flow Rate	Specify the airflow rate required for the clean air source. (Or specify port size or diameter).
Provide a Constant Vacuum Source	Air Flow Rate	List the airflow rate required for each of the manifold vacuum ports. (Or specify port size or diameter).

Table 3-2. (Part 1 of 2) Application Specifications and Characteristics (Applied Under Engine Operating Conditions).

Characteristic	Specifications	Definition
Sense Throttle Position	Sensors supply voltage	Specify the voltage and tolerance of the sensors supply circuitry from the ETC controller.
	Sensors Resistance (Contacting TPS design)	The two sensors can have different resistances. Specify the minimum resistances for the two sensors. (Or specify the maximum supply current for the sensors.)
	Output at Minimum Mechanical Position	Throttle position in percent of the supplied reference voltage on the Throttle Position Sensor output when the throttle is closed to the minimum mechanical position stop. Vibration and vacuum may contribute to the position output. Tolerance must be accounted for when specifying the acceptable output range at minimum mechanical position.
	Output at WOT (Span Angle)  <i>Note: This is typically not the same position as the maximum mechanical position)</i>	Minimum throttle travel output from idle to WOT is sometimes referred to as "span angle". WOT is the engine controller's 100% throttle position. For current systems, the output at WOT is 78% of reference voltage higher than the output at the minimum mechanical position. This is obtained from nominally 87° of rotation with a 0.9% per degree TPS slope. Actual output would be around 88% of Vref ( $\pm$ the tolerance at minimum mechanical position).
	Correlation	Correlation is the maximum variation between the two outputs of a dual track TPS after they have been converted to the same scale. (One output is inverted).
	Repeatability	Repeatability is the maximum variation for the TPS Output at any given Throttle shaft angular position. This is strictly a TPS specification that is difficult (at best) to measure when installed on an Air Control Valve.

### 3.4 Operating Conditions

The ETC-Air Control Valve Assembly operates normally in the modes in Table 3-5.

Operating Mode	Operating Conditions
Air Temp.	-40°C to 40°C
Underhood Temp.	-40°C to 125°C
Intermittent Temp.	150°C (1 hour maximum)
Max. Vacuum Load Across Throttle Shaft	90 kPa
