OBJETIVOS

- Simulate 13-bus distribution system in static mode
- Evaluate the power, voltage and current of the system loads
- Describe the power flow
- Time-series simulation (simulation over a day with one hour time interval)
- time-series static with and without resources (PV systems)
- Model a storage system in the network

ARQUIVO SUMMARY

Este projeto apresenta, inicialmente, a importância da mudança da estrutura atual do setor elétrico brasileiro através da implantação do conceito de redes elétricas inteligentes nos sistemas de distribuição. Nesse cenário é imprescindível a utilização de softwares capazes de dar suporte a essa evolução. No presente trabalho é utilizado o OpenDSS. Com o objetivo de descrever o conteúdo metodológico e verificar as funcionalidades desse software apresenta-se uma forma de construção das matrizes de admitâncias nodais dos elementos de rede, de uma rede completa, a descrição do método utilizado para cálculo de fluxo de potência e, além disso, são apresentados os diferentes modos de cálculo de fluxo de potência e os modelos de geração distribuída disponibilizados pelo software para a simulação da rede teste IEEE 13 barras. Por fim, são apresentados os resultados das simulações realizadas em um sistema de distribuição real com a finalidade de se analisar os níveis de suas tensões. O sistema é modelado no software OpenDSS através de dados fornecidos por uma distribuidora americana de energia elétrica. Esse estudo é realizado em conjunto com o EPRI e tem como principal objetivo atender as demandas de planejamento da distribuidora americana.
